of the French and German schools, nearly always puts his very strongest colour into the high lights, and his half-tones look, in consequence, poor and thin, while not infrequently vulgarity sets its seal upon his work.

There are, of course, exceptions to every law, but in the main this great colour principle of nature might, I think, be shown to be of value in every form of art into which colour enters. And, turning from painting to architecture, I cannot help thinking that the better recognition of it ought also to be of some assistance.

Though it may not have been definitely worked out in the minds of some of the architects in the Middle Ages and the Early Renaissance, it would seem more than probable that it influenced some of their work. Perhaps some of the brick and marble architecture of Italy and Spain show this. But whether this is so or not is a matter of relatively small importance, for in architecture, as in all else, progress, building upon selected precedent, ought surely to be more striven for than imitation.

To take one or two examples of how the observance of the principle might reasonably affect architectural design; in exteriors, in which varied colour enters, it would indicate the undesirability of putting a weaker colour into a cornice immediately under the eaves of a building, into the under-cut portion of a projecting moulding, or into any hollowed or shadowed surfaces, rather than into those exposed to the full strength of the light. Conversely if it were desired to strengthen the general colour effect, it would be well to enrich the former with relatively strong and warm colour.

One is often struck, from the painter's standpoint, by the way in which a building of warm-toned material has been made unbearable to the artist by the shivering

Coldness of its Painted Woodwork,

just where the eye, accustomed to nature's methods, would expect additional warmth and richness.

Examples of the advantage of keeping recessed mouldings warm and full in colour may easily be found in the mixed brick and terra-cotta architecture of Italy, especially of such districts as those of Pavia, Milan, Bologna, and Brescia. In the church of Chiaravalle warmth and richness of colour are throughout introduced into the shadowed mouldings, and cool coloured materials are always avoided in them; and the same thing applies to the exquisite little campanile of San Gottardo at Milan. Numberless other instances might be adduced, but I would rather suggest practical experiment than precedent. I am not contending either that the general colour or portions of the colour of a building should not, if it is desired, be pale or cool, but merely that the relative paleness or coolness of its parts should, if the colour be varied at all, be in the right place. A whitewashed cottage is often delightful, but the violent contrast of much modern white woodwork is detestable, coming, as it often does, just where it is not wanted. So, too, the cold grey frieze or decorated coving of stucco or cement, which is sometimes to be found under the eaves of a red brick building, is often most injurious to its colour scheme. It is cool colour in the wrong place, and it is, I think, especially to be avoided in our sunless climate, where there is no assistance to be obtained from shadows full of rich reflections, and where colour is so much needed in our buildings. We may also draw the further deduction that if the architect uses the richest colour at his command in his high lights, it will not merely be wasted but actually injurious. Experiment will, I think, prove the main contention. We must remember also that

Colour is so Potent

that it may completely overpower the light and shade of a design. It surely cannot then be right to use colour in such a way as to lessen the effect of the carefully planned light and shade which the architect has given by his mouldings and other projections and recessings, and observance of this law of colour will, perhaps, help to prevent our doing so.

In addition, it is a significant fact that the experience of the painter shows that by working thus in harmony with the principles of nature it is much easier to deal with strong colour and yet make it look refined. If an example were required to prove this, I might instance Albertinelli Visitazione at Florence.

The next principles to which I propose to refer are the twin ones of "inter-contrast" and "quality." "Inter-contrast" may be described as that interweaving of divergent colours which tends to make them appear pure and luminous. "Quality," a vague term to which various meanings are attached, may be roughly defined for our purpose as texture.

In painting the appreciation of and the careful striving after these characteristics of good colour by an artist have much to do with his position as a colourist. For a second-rate and insensitive colourist there is none of that

Exquisite Vibratory or Living Quality

which makes it uncertain whether the tendency of a given colour is in one direction or another, and renders it difficult to analyse it.

In the work of a great painter there is hardly any quiescent or absolutely flat colour. It is all full of palpitating life, and is composed of slightly differing and opposing tendencies and woof and weft of hue towards the warm and cool end of the scale. Take, for instance, the dark-toned sea in the work of a good painter. Here its broken quality shows a slight tendency towards green, there towards violet or purple. Perhaps there is a broken red tone under it which tells through; perhaps there are particles of orange which do the work of rendering it luminous and transparent. Take what looks like a nearly plain blue sky which yet is full of light and not a mere surface covered with a coat of paint. Examine it, and you will find that warm and cool colours, separate or only partially overlaid, telling through each other, give it its chief charm, a suggestion of that exquisite quality which Longfellow suggests when he speaks of

> The tender azure of a sky
> Just washed by April rains.

The physical and optical reasons for this are not far to seek. The retina is excited by the juxtaposition of colours of a slightly complementary tendency in small quantities just as it is by larger adjacent masses. The mind also is stimulated by the introduction of an element of mystery into the resultant tint which gives those possibilities for the imagination without which no art work is quite satisfying.

I need not pursue this part of the subject further. I would rather appeal again to nature and assert for her that no colour of hers is ever without this characteristic in greater or less degree, and that where it is especially present there her colour is of the loveliest kind, as, for instance, in the shimmering atmospheric tints, and in substances like mother-of-pearl and opal. In a word, experience suffices to show that

Inter-contrast is Essential

to give colour its full power and interest. It is the art principle of "exchange" or colour balance—upon which I shall touch shortly—carried much further, and is of vital importance. And not only are interminglement and inter-contrast of much value, but also in many cases what, as I have said, the painter calls "quality," or texture. All nature's colours are full of this, and though it is sometimes so subtle as not to be easily observed, and the resultant colour-tint seems almost flat, it is nevertheless omnipresent, and it exists, of course, side by side with interminglement of colour tones.

It is obvious that these two sister principles are also very applicable to colour in architecture. One sometimes sees a building or part of a building which is interesting in its forms and detail, and at the first glance is not absolutely bad in colour, and yet one feels it is monotonous and unsatisfactory, and that it would be impossible to sit down and paint it. One asks oneself "Why?" and one discovers it is because its colour surfaces are dead and uninteresting, and because there is no play of intermingled colour and no "quality" in them.

There are many ways in which this dull monotony might have been avoided, at little, or perhaps no, extra expense, by better commingle-ment of material, by rougher and less machine-made surfaces, or perhaps by saving the cost of a little carved detail and putting it into the colour scheme. It is, moreover, not only a question of good colour and quality, but also of contrast. In a picture it is essential that different kinds of things should be painted with a different touch; that some should be expressed with smooth sweeps of the brush, others by roughness and loading of the pigment. Variety of handling is necessary to avoid monotony. And as

Texture so Much Affects Colour,

the architect also can by using varied and contrasting surfaces make the colour of his stone, brick, metal or other material more pleasing to the eye.

If this applies to exteriors, how much more to interiors. There the architect has endless opportunities for producing colour which shall be real colour and of educating the colour sense of his clients. Paint, distemper, and other stains, gilding, coloured materials of all kinds, give him a palette almost as rich and varied as that of the artist.

Much of our modern colour decoration, ignoring as it does these two delightful characteristics of good colour, namely, quality and inter-contrast, is crude and offensive, or severely cold and inartistic, and though it is not of course contended that relatively plain and flat surfaces of colour should never be used, even when they are employed they may be made more luminous or interesting by some attention to these principles.

"Inter-contrast" and "quality" may perfectly well exist even in what appears at a little distance to be a relatively flat surface; and, of course, this has to some extent been recognised in modern decorative work of the best kind. Apart from artificial surface colours for internal decoration these characteristics, of course, come into evidence in many materials which are in use for decorative purposes, and which, as in the "encrusted" architecture of Venice and Arabia, may add great charm to a building. In textured marbles, for instance, the transparent play of colour is one of their chief sources of beauty, as it often is in the vitrified colours of tiles and in various metallic or semi-metallic surfaces. Distance also often blends decorative colouring, when the individual colour spots are somewhat crude, into rich masses of colour apparently full of quality and iridescence, and in large buildings this fact might perhaps be taken more advantage of.

Granting that these two characteristics help much to avoid monotony something further is also frequently required which, while assisting the general harmony of the colour scheme of a picture, tends still further to prevent it. The painter finds this in the large and broad principles which he sometimes calls

"Exchange" or Partial Repetition.

"Exchange" as applied to colour may be described as the carrying over of a smaller portion, or repeat, of one colour mass into another. In most scenes in nature which strike us as especially beautiful we find this constantly occurring.

* Fuselli.

The deep blue of the sky is carried down in smaller quantity by cool cast shadows or reflections from water or leaf surfaces into the warm tints of a landscape, and the effect gives us exceptional pleasure. The red of the sunset repeats itself upon rocks or tree-stems, or is carried into the cool tones of a green glade by touches of autumnal foliage, and we again feel a sense of satisfaction in the colour chords.

As in nature, so in art; and in the work of almost every good painter you will find the principle carried out, even though it may have been less the result of deliberate intention than of unconscious artistic feeling.

To go no further than the pictures in our own National Gallery, plenty of examples might be quoted. I will refer to only two. In Titian's "Bacchus and Ariadne" there is a deep-toned distance of remarkable strength and purity. Its colour is repeated, or exchanged over, into the warm tints of the figures, while some of their rose-coloured drapery is carried up into the sky. In the "Virgin and Child," by Fra Bartolomeo, part of the drapery of the Virgin is a very peculiar cool greenish-grey blue. It has its exact counterpart in the colour of the sky, while portions of the flesh tones are also repeated in the clouds.*

It is evident that it also applies to architectural design, that many buildings owe part of their satisfactory colour to it, and that it might help to redeem the colour scheme of others. In many cases

The Colour of a Building Material

has nothing to do with its strength or utility, and there is a fairly free choice to the architect, apart from his opportunities for giving artificial surface colour in interiors and elsewhere. The principle would seem to be very beautifully carried out in parts of the exterior of St. Mark's, and in many other Venetian palaces in which small spaces and panels, and even dots of colour, are carried down into other masses and help to give unity without monotony. So also in some excellent buildings of the Early Renaissance elsewhere in Northern Italy and in many Spanish ones which I have sketched with delight. But although a good many precedents may be found amongst the exteriors of architectural buildings, colour has apparently for a long time been so little considered in their design that it is rather to the future treatment of them, when there may be more feeling for colour, that I would suggest that the principle may apply. No principle, however, can do more than assist the artist, and much artistic feeling is always required to carry out colour repeats and exchanges successfully.

Taking two more detached principles from the sister art, I would refer next to those of

Gradation and "Focussing."

We all know how important a part gradation plays in Nature, and that scarcely a colour space can be found in a landscape in which it is not present almost to the verge of infinity. Beauty of colour does certainly depend on it in a large degree, and is still further increased in many instances if the gradation culminates in a focus or spot of colour which is predominant.

How, it may be asked, can these principles possibly apply to architecture? Perhaps you will permit me to answer that question by a very brief description of a building which is to me amongst the most beautiful pieces of architectural colour I know in Europe, and to which I have made more than one pilgrimage. I mean the Palazzo Publico of Piacenza. It is a structure of considerable size, interesting and beautiful, not only in respect of its colour, but also as to its general forms and details.

The first storey of the north façade is carried upon a substructure of pointed arches raised upon piers. These latter are of cool-toned marble, coolest at their bases, and gradually intermingled with stone of a warm tone, which approaches a delicate pink grey of indescribable tint at the upper part of the arch and in the spandrils. Warmth of colour thus having been led up to, the first storey is built of terra-cotta of about the colour of red sandstone, the grey of the substructure is "exchanged" into this in small quantity by the marble shafts of a line of extremely beautiful windows, and the colour tends towards increased warmth as it rises to the battlements above it. These are finally of red brick of the deepest burnt sienna, mellowed and qualified, of course, by irregularity of tint and the action of time, but still a splendidly strong "trumpet blast" of red against the sky.

The building is as harmonious in colour as a Bellini background, and it is, I think, an instance of what might be done by introducing the painter's principle of gradation in exteriors.

Nature is continually employing it in the happiest way in her treatment of buildings. I have often painted a roof in which the tiles have been toned down by time to one large gradation towards brown umber or a russet grey, whilst perhaps some interesting feature remains the strongest note of the original colour.

Leonardo da Vinci thought painters might learn a good deal from an old wall. So, perhaps, Nature's treatment of the colour upon a roof may have some significance for the architect. The builders of the delightful old Tudor houses of Gloucestershire varied the size of the shingles or tiles in a progressive ratio towards the ridge. Why should not we vary our colour somewhat similarly? This is, of course, a matter of opinion; but gradation being a source of beauty in colour, we should at least be careful not to destroy it where it is given by curved surfaces and gradually increasing shadows, which even a few spots or patternings of colour which are out of tone may easily do. "Focussing" also is unquestionably of great use in painting, in rendering colour more interesting, and in accentuating features or details which it is desired to bring into special notice; and in colour schemes for architectural buildings I think it might also be made use of.

A most important aid to the painter in making his colour tell with some approach to the force it has in Nature is of course

Contrast.

In fact, it is at the very root of the painter's art. Without contrast he cannot even express a sense of light. So too with regard to colour; the full force of colour can only be felt under conditions of contrast, just as movement can best be realised in opposition to repose. Contrast is, however, so powerful an instrument that the best painters are careful not to overdo its use. A picture is helped by one or two passages of strong opposition—sharp darks entering boldly into lights, or warm colours telling forcibly against cool ones—but in the greater part of a good picture the artifice is not resorted to, and harmony may easily be destroyed by over-contrast, which is the besetting vice of the second-rate painter. It is a very keen-edged, though valuable, tool, and may easily cut too deeply; and I submit that these considerations apply quite as much to colour in architecture as in a picture. More buildings seem to be ruined by over-contrast than from any other cause, and it is certain that many otherwise fine buildings are often prejudiced in cultivated eyes solely by reason of it.

It is scarcely necessary to call to your minds some few buildings in London in which strong contrasts have done their vulgarest worst, and seem to have tried to shout down that implacable enemy of the modern architect, the street advertisement.

Still, so valuable a resource as strong contrast cannot be neglected, and in all contrasts the question of the relative quantity of the colour masses is an important factor. A violently opposed colour which would be unendurable when in large volume will be no longer irritating if it is in very small quantity relatively to the principal colour masses. It is often most successfully employed in pictures in very small points of opposition, and it may also be of great use if skilfully introduced in forcing several rather too divergent colours into harmony, just as a slightly discordant accidental is often valuable in musical composition.

Examples of this may, of course, easily be found in the works of the great colourists and also in the ornamental embroideries, enamels, and mosaics of the good colour periods and nations, especially in those of India, Persia, and Japan. In architecture I have seen many charming examples in Italy and Spain and in other parts of Europe. The harmonising effect of the detached and isolated points of strong colour in many Moorish and Arabic buildings is often delightful. Skilful contrast of colour would seem to be of special use in architecture where the building itself is relatively uninteresting.

Time presses, however, and leaving some other general principles upon which I should have liked to have touched, I must pass on to two final ones which are closely related, and are certainly common to the arts of both painting and sculpture; namely,

Breadth and Harmony.

It seems almost absurd to mention such well-recognised qualities; but I venture to think that, although harmony and breadth of colour are often talked about, they are not such simple matters as most people suppose. We are deceived when we look at a great and harmonious picture by its apparent simplicity, and we fail to realise how carefully through all its colour scheme the subordination of every particle of colour has been felt out. No art work can be really great without harmony and without breadth, for they are necessary to that artistic unity which is the most universally accepted of all laws in art: namely, that in a given work some one essential idea or impression shall hold the attention or appeal to the emotions.

Harmony does not, however, mean monotony, and a picture will be greater and more impressive if, while containing a great range of colour, it is still harmonious.

A Musical Chord

is built up of divergent tones, but they bear an inter-relation; and just as in music there is a science of harmony which is of some assistance to the musician, and which is founded upon physical and physiological facts, so in colour, as I believe, there are underlying physical laws which, if we knew more about them, might be of great assistance to us. The universe is built up of what we are pleased to term laws, and it would be strange if there were none which underlie our pleasurable and painful sensations with regard to colour as they do with regard to music. Be this as it may, what I would submit once more is, that as harmony of colour is of the first importance in painting, it is also of the first and greatest importance in colour as applied to architecture, and in much of our modern work is insufficiently studied.

Nature, if you leave her alone, tends to harmonise the discords of colour of almost any building, softening down the sharp contrasts, overlaying the surfaces with lichens, or toning them down by time stains and oxidisation; but we often refuse to learn from her, and go on cutting up our pictures with a patchwork of violently opposed colours, and destroying the effect of our buildings by crude contrasts and over-emphasis.

Systematic study of harmonious colouring would thus seem to be as needful for architects as it is for painters; and as it is now mainly a matter of artistic feeling—whatever help we may some day obtain from scientific systems of harmony and counterpoint, somewhat resembling those of music—I would put in a plea for the study by architects of the great masters of colour in the sister art of painting. Amongst the old masters of such painters as the Bellini and Perugino, Titian, Veronese, Andrea del Sarto, Velasquez, Luini, and Giorgione, and amongst the moderns, Turner, Sir Joshua Reynolds, Watts, Burne-Jones, Lady Waterford, Müller, Albert Goodwin, and other members of that great school of our English water colourists, which is universally recognised abroad as being without a rival in Europe, but which we ourselves are too apt to depreciate.

Pictures are interpretations of, or siftings from, the great colour schemes of Nature, and they are easier to study and analyse than those of Nature herself.

Careful Analytical Colour Studies,

as opposed to mere copies made from the pictures of great colourists, may, I think, do much to educate the eye and something towards discovering some of their principles.

Most painters plan out in their minds some

* Other instances of more complexity may be found in the following pictures:—Ghirlandaio's "Procession to Calvary"; Garofalo's "Madonna and Saints"; in almost every Turner; and most of the pictures of Rembrandt, Vandyke, and P. de Hooch.

more or less clearly-seen scheme of colour for their works. Some go further and make a definite colour-scheme upon paper, which, if it is not allowed to chain down the ideas of the painter too much in the development of his picture, is an admirable plan. It might be, and, I suppose, often is adopted by the architect. But in order to conceive a good colour-scheme, the colour sense of the artist must have been developed. He must have the same kind of experience and feeling which enables the musician to combine musical sounds. Apart from what has been said as to the study of pictures, some few additional means of training the eye and the mind may, perhaps, be suggested. Notes made direct from Nature of natural combinations and composition of colour are, of course, valuable. They should, I think, not be too detailed, but made rather with a view to

Decorative and not Realistic Colouring.

They will, of course, not only store the memory, but will help to educate the powers of observation.

As the appeal has been made to Nature it may, perhaps, be objected that art is art because it is not Nature. But all art is, as a matter of fact, founded upon Nature; and it would at least seem probable that, as we live surrounded by Nature's laws and Nature's pictures, what is out of harmony with them is probably bad both for our eyes and our intellects. The Creator can scarcely have intended us to live in opposition to them.

Of course, I need say nothing to you of the study of Oriental and other systems of colour decoration.

One curious result of the systematic study of colour carried out in this way is that it also usually develops a more sensitive feeling for form, for, notwithstanding what has been said by some writers, it is hard to enjoy a space of colour without being influenced by its form.

Lastly, throughout what I have said I have assumed that what is beautiful and harmonious in colour is admirable. I cannot conclude, however, without touching upon another side of the question. We live in a strange period of the world's history, and just now, among other strange things, there is what most of us think a morbid current of reaction both in literature and in art towards

The Ugly and the Repulsive.

We know to what this has led in naturalistic literature. The question for us to decide is whether we shall allow ourselves to be influenced in the same direction towards the ugly in art. I trust, for my own part, that the answer may be emphatically in the negative. The movement has dragged many into it through fear of their being supposed to admire what the opponents of beauty often contemptuously call the "pretty." It also includes those amongst impressionist artists whom William Morris has spoken of as "loudly proclaiming their enmity to beauty" as a deliberate choice, and I think, in addition, not a few who have absolutely no sense of the beautiful, but who look upon art merely as a mode of expressing facts or ideas. If art is not to rest upon beauty as its chief foundation it would seem to me to have no *raison d'être*. We had better give up attempting to be artistic, and confine ourselves to empirical science. Architecture would then no longer be an art, but merely the science of building, and could be left to

The Builder and the Engineer.

In such a view of art good colour could scarcely find a place. But this side-current (for, after all, it is a side-current, though it may lead to a dangerous cataract) has arisen principally, as far as colour is concerned, from the weakness of the colour sense at the present time. It is also a standing temptation both amongst artists and critics to place technical skill in front of the higher qualities of an art work, and the production of good colour is one of the least obvious evidences of technical skill. So it is somewhat underrated.

Perhaps we may trace some slight reflection of this spirit in some of the recent architectural buildings which have risen around us, and in some of the current opinions about colour in architecture that we hear expressed. Let us beware that it does not help to make the flickering flame of such feeling for beautiful colour as exists amongst us burn yet lower.

Lastly, as one who believes that a field lies open for the creation of a pure colour art, wider and greater in its influence and differing from anything that we have yet seen, and which might do much to add to the joy and culture of life, may I venture to say that whatever architecture may have done in the past for

The Development of the Colour Sense,

it has it in its power to do much more in the future? Architecture is the one art with which all classes are in contact, and which perhaps more than any other has the opportunity for silently presenting and interpreting beautiful form and colour to them. And those of us amongst painters who love and reverence good architecture with an intensity which we cannot put into words, and who have drawn so many of the great buildings of the past with a thrill of enthusiasm which we can never forget, sometimes have visions of cities in which every building should be full of interest and beauty, and in which colour should play an infinitely greater part in architectural design than it does at present.

And as tending towards the realisation of such a dream, which we know from the experience of the past is not altogether chimerical, I cannot help thinking that the closer association of the two great arts of painting and architecture may be of assistance to both, and that, more especially in regard to colour, architecture might perhaps honour painting by considering some of her principles and methods.

I would therefore ask you to consider anything I have said thus briefly with regard to a few of the best recognised of them as merely suggestive of some trains of thought with that object in view, and which you may possibly think it worth while to follow out in the light of your more practical experience of architectural design.

THE DISCUSSION.

Mr. G. H. Fellowes Prynne, in proposing a vote of thanks to Mr. Rimington, said that only by sympathy with the painter could architects hope to bring colour into architecture. He thought that architects were somewhat afraid to use colour in a building, as they had made so many mistakes. In using colour they must not be afraid of the primaries or high colours. If, however, colour was used in England as in Venice it simply looked garish. In interiors this of course did not apply.

Mr. J. D. Crace in seconding the vote said colour had always suffered from the want of a law, though the theory that it was allied to music was as old as Aristotle.

Mr. A. T. Bolton thought the question of colour could not be excepted from the climate. There was much colour effect given by weathering. Historically speaking, when the great decorative work of the past was produced the painters were really less advanced than they were now. Modern painting was really the study of lighting. The old painters were working in a conventional way which suited the conventional architecture of the time. It was here that modern painters and architects had parted company. With regard to the Palazzo Publico of Piacenza the colour effect mentioned by Mr. Rimington was in all probably not the intention of the architect, the different coloured materials being of various dates. They must be very careful in introducing colour into buildings.

Col. Luard next spoke. Mr. Seth-Smith felt with Mr. Bolton that climate was a very important point in this subject. In northern countries, where the climate was little better than our own, costumes were full of colour and had not been vitiated by the deterioration in taste. As architects they felt that the great conventionality of their lines and the very limited power of varying their materials made the application of the principles advocated very difficult. But many of the architects in the provinces had worked upon those lines, attending carefully to their colour of materials and the texture.

The vote of thanks having been carried by acclamation, Mr. Rimington, in reply, said, with regard to the building at Piacenza, he had only used it as an illustration of a beautiful building. He had in his paper in the same way given other instances, with the reservation that they might perhaps be copied. He could not agree that we required less colour than in a country like Italy with a brilliant climate. He did not mean his remarks to be applied only to strong, but also to delicate colour. Architects should of course apply colour in their own way, conventionally, and not as painters: he only meant that some of the principles might apply to both.

New Patents.

These patents are open to opposition until January 14th.

1899.—Hot-water Boilers. — 22,173. C. B. PEAKE, 73 Fountain Square, Fenton, Staffs. The top of the boiler is sunk in the middle so as to allow the pinheads which fasten the lid to lie level with the surface.

Gas Burners.—23,088. J. WILSON, 42 Plaistow Park Road, Essex. Inside the burner is a slotted disc and a spiral spring which allow only sufficient gas to pass to ensure perfect combustion, irrespective of the pressure on the mains.

Chemical Chimney Cleansers. — 24,375. T. HUSON, 13 Batavia Buildings, Hackins Hey, Liverpool. The cleanser consists of nitrate of potash, 56 parts; sulphate of soda, 26 parts; and sulphur, 18 parts. It is burned on the fire and acts by partly consuming and partly dissipating in fine particles the soot in the chimney or flue.

Drawing Pins.—24,489. F. H. SHAW, Universal Wood-working Company, Newhall Hill, Birmingham. In order to facilitate their removal, the pins have a lifting tab of leather or other suitable material fixed to their heads. Several modifications are shown, one with the tab projecting at the side, so as not to be in the way of the drawing appliances.

Ceiling and Wall Coverings.—25,526. L. H. RITTMAN, 26 Norfolk Street, Strand, W.C. (communicated by La Société Josz et Fils et Cie., Brussels). The covering which forms the subject of this invention is impervious to moisture, acids and corrosive salts. It consists of paper or fabric first steeped in a solution of liquid gutta-percha, mineral pitch, turpentine and a liquid siccative; then dried; then covered with a layer of white lead; dried again; and finally given a coat on one side of zinc white ground in copal varnish and clear linseed oil. It is affixed to the wall or ceiling by a liquid solution of white lead crushed in linseed oil and a siccative containing gutta-percha.

1900.—Bacterial Purification of Sewage.—2,647. H. B. KILLON, 22 Cooper Street, Manchester. The object of this invention is to produce an apparatus by which the flow of sewage automatically affects the filling and emptying of several beds in regular sequence, at the same time allowing an interval of rest to occur. This is accomplished by employing a series of syphons, floats and valves so arranged and connected with a corresponding series of filter beds that, upon the collection of a regulated quantity of liquid in a suitably disposed chamber, such liquid is automatically discharged by one or other of the syphons on to one or other of the series of filter beds.

Drawing Scales.—13,694. E. L. SYKES, 1 Grant's Lane, Calcutta. This invention relates to the scales used in making geometrical, mechanical and architectural drawings. It consists of an ordinary scale having a short pointer permanently fixed at zero and a slide, also provided with a point extending beyond the edge of the scale. By this means measurements can be pricked off directly on to the paper.

The following specifications were published on Saturday last, and are open to opposition until January 21st. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—18,322, CAMERON, COMMIN AND MARTIN, apparatus for regulating the delivery

of sewage to filters or on to land. 22,898, McDOUGALL AND HAIGH, feed-water filters and fittings. 23,211, COWING, bascule lift bridges. 23,456, ROUNSIVELL, portable lift or loading platform. 24,586, MATTHEWSON, sanitary flushing apparatus. 25,036, MURTON, VARLEY AND MURTON, cutting tool for forming rectangular holes or openings in metal, wood, &c. 25,139, SIEVERT, manufacture of sheet glass.

1900.—400, LEE, electric arc lights. 564, GEHLE, locks and bolts. 641, SHANKS, hospital sinks and water-supply apparatus therefor. 792, BIRCH, incandescent gas burners. 797, HISLOP, device for use in lighting and extinguishing gas lamps. 860, LANGFORD, means for automatically regulating and for indicating the speed of filtration of water. 940, SHANKS, water-closet apparatus. 1,081, STRAWSON, pumps. 2,961, NORDTMEYER, filtering medium. 5,756, BALE, kilns. 7,499, BECSEY AND SZALAI, smoke-consuming apparatus for furnaces. 10,588, SCHNIEWIND, enrichment of gas. 13,363, BEHMER, machines for ramming paving material, &c. 14,015, NEWMAN, door springs and checks. 15,696, COLES, cranes. 16,641, KILIAN, apparatus for moulding pulverulent materials. 16,979, FAZAN, generator for acetylene gas. 17,481, BROWNLEES, gates and gate fittings. 18,019, SCHUMACHER, removable and collapsible window-cleaning stand. 18,109, DOELP AND PERFECT, nut locks. 18,466, MACNAMARA, door bolts and locks.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

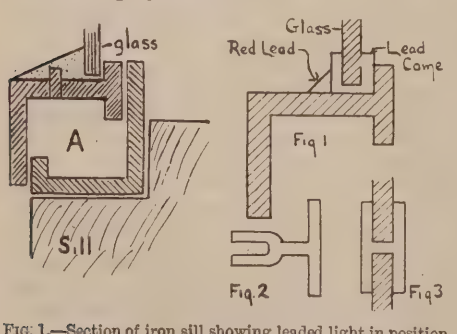
Honours Examination in Brickwork and Masonry.

PAISLEY.—J. S. B. writes: "Which are the best books to study for examinations in honours brickwork and masonry?"

One of the best books is Rivington's "Notes on Building Construction," 4 vols. (London: Longmans). "Brickwork," by F. Walker, 1s. 6d., and "Masonry and Stone Carving," by Edward Dobson, 2s. 6d., are also good books, published by Mr. B. T. Batsford, 94 High Holborn, W.C. G. H. B.

Iron Casements.

LONDON, N.W.—STUDENT writes: "(1) Is the section of iron casements (to open outwards) shown at A on the accompanying illustration watertight? (2) Which is the proper way to fix lead lights to this section? (3) What is the proper shape and size of the lead bars, and how is the glass fixed to them? (4) If the wooden sill projects from the face of the brick-



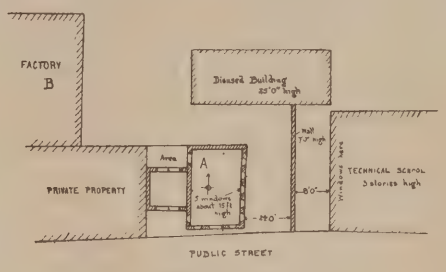


FIG. 1.—Section of iron sill showing leaded light in position. FIG. 2.—Lead came before glass is inserted. FIG. 3.—Came after glass is inserted.

work, is it necessary to have a brick sill as well?"

(1) Yes; but water would lie in the channel of fixed iron sill unless a way of escape were provided by holes drilled through the external angle. (2 and 3) See accompanying drawings, Figs. 1, 2 and 3. (4) A properly weathered and throated wood sill is sufficient. G. A. T. M.

A Question of Light.

PAISLEY.—J. S. B. writes: "The church marked A on the accompanying sketch is surrounded on the east and north by a private lane leading to a factory, B. The church was built some years before the factory, and depended principally on this lane for its light. Since B built his factory, and took possession

A QUESTION OF LIGHT.

of the lane, he has charged the trustees of the church at the rate of £5 5s. per year, as a guarantee that he would not build on the lane and obstruct the light. The trustees have ceased to pay the charge since the new Technical School has been built, believing that B would not be allowed to raise any obstruction. Do you think that B can force payment, or, failing payment, could he build so as to obstruct the light of A; also can B object to tradesmen standing ladders on his ground while repairing the church windows?"

It does not appear that the trustees of the church, A, have acquired any right of lighting over B's private lane; and as the said trustees appear to have broken their agreement with B, he is free to build on his own ground, and may build so as to obstruct the light to the church. He may also build so as to obstruct the light to the windows of the Technical School, if those windows are not ancient lights. Twenty years' uninterrupted enjoyment of light through a window makes that window an ancient light, and new windows may have the same rights as ancient lights, if they are in the same positions and include the shapes and surface-areas of windows in a previously existing building. G. H. B.

Liability of Local Authority for Accidents caused by Projections on Road.

HIGH WYCOMBE.—SUBSCRIBER writes: "In the main road of a municipal borough the road metal wears away and leaves the iron frame of a sewer manhole projecting to such an extent that an accident happens to my horse. Are the authorities liable for damages sustained? Has there been any action fought upon similar lines?"

It appears that the local authority would be liable for the damage sustained. In the case of *Kent* v. *Worthing Local Board*, in 1882 (10 Q.B.D. 118), the iron cover of a water valve was properly fixed in a highway by the defendants, but in consequence of the ordinary wearing-away of the highway it projected in such manner as to injure the plaintiff's horse. The court gave judgment for the plaintiff for £21 and costs. G. H. B.

The Architect's Diary.

TEDDINGTON-ON-THAMES.—J. D. C. writes: "Where can I obtain a copy of 'The Architect's Diary' for 1900?"

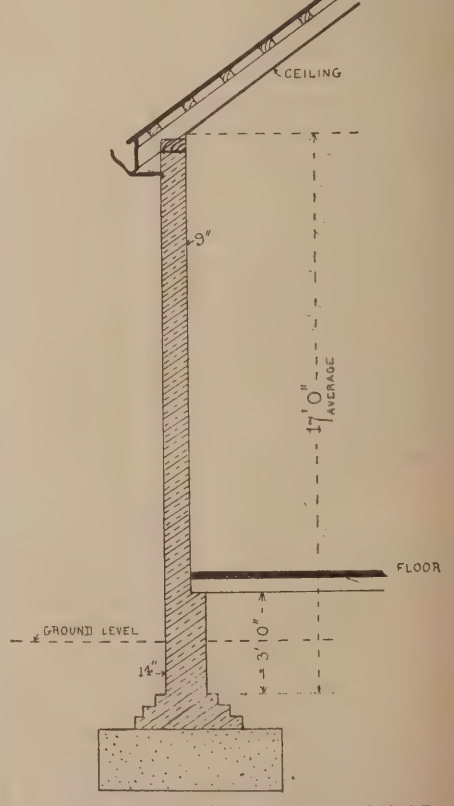
This book can be obtained from Messrs. Hudson and Kearns, Southwark Street, London, S.E.

Half-Timber Work.

AYR, N.B.—KINNOULL writes: "Can you inform me if there is a book published on half-timbered construction, giving all necessary details, &c.; if so, where can it be obtained?"

No work has been published that deals comprehensively with half-timber work from a constructional point of view. Some plates of details are given in the third volume of the "Abbey Square Sketch Book" (£3 3s., B. T. Batsford, 94 High Holborn, W.C.). There is also a small chapter on the subject in "Mitchell's Advanced Building Construction" (4s. 6d., Batsford). Articles dealing with half-timber work have appeared in Nos. 54 and 55 (February, 1896), Nos. 144 and 150 (December, 1897), No. 178 (July, 1898), No. 227 (June, 1899), and No. 236 (August, 1899) of THE BUILDERS' JOURNAL.

Book on "The Orders."



WOODSTON.—P. G. C. writes: "Kindly name a good book from which I can draw out the 'Orders.' I would like a book which combines the history with good examples, giving the proportions."

"Orders of Architecture," by R. Phené Spiers, 8s. 6d. Published by Mr. B. T. Batsford, 94 High Holborn, W.C.

Thicknesses of Walls required under By-laws.

ST. ALBANS.—BY-LAWS writes: "Is the accompanying diagram in accordance with the requirements of the Local Government by-laws as regards thickness of walls of buildings of the warehouse class up to 25ft. in height, or should the wall be all of 14in. work? It might be argued that it would be better if built in 14in. work for its full height, but can this be enforced? In 'Knights' Annotated By-laws,' diagram 8 shows a wall less than 25ft. in height with a 9-in. topmost storey and 14in. base, and, so far as I can gather, the height of either thickness is not limited."

By-law 17 (*a*) for St. Albans provides that where the wall does not exceed 25ft. in height it shall be 13½in. thick at the base. This does not regulate the thickness at the top of the wall. Under (*j*) we have the general rule for warehouse walls, which must be 13½in. thick at the top, and for 16ft. below the top, except in storeys not exceeding 10ft. high. This case does not come within the exception, and therefore the wall must be 13½in. thick at the top. Under (*k*) if any storey exceeds in height fourteen times the thickness prescribed for its walls, the thickness of the walls must be increased to 1-14th of the height. The height of a topmost storey, under by-law 15 (*i*) (*a*) is to be measured from the floor to half-way up the roof, when there is no tie. In this case no tie is shown, nor is the height of the roof shown; but if the height mentioned exceeds 15ft. 9in., the wall must be thicker than 13½in. G.H.B.

THICKNESSES OF WALLS REQUIRED UNDER BY-LAWS.

Clay's Patent Mercury Regulator.

CRAWLEY COURT, HANTS.—Clyde would be glad if any reader could state the name and address of the maker of "Clay's Patent Mercury Regulator."

Laying Wood-Block Floor.

HULL.—F. S. writes: "Which is the best material to use in laying a wood-block floor, and how is it used? The blocks are 1½in. thick, laid on a cement foundation."

In laying wood-block floors the area to be floored should be excavated to a depth of 6in. or 8in. below the intended floor line, and then levelled and well rammed. Stakes should then be driven into the ground about 6ft. or 8ft. apart around the space, with their heads levelled to the required height of the concrete, which should be poured in, rammed, and struck off to the tops of the stakes. After allowing a few days to elapse, screeds of cement 3in. wide and 1in. thick should be run around about 6in. from the walls, carefully levelled and made straight with rules. The whole space should then be floated with Portland cement and struck off from the screeds to a level surface When this is dry it should be swept clean, and (about 2ft. at a time) be well covered with boiling tar. Dantzic red deals, "flatted," make good blocks, so also do Gefle white battens; pitch-pine wears well but splits in drying. The blocks of wood should be ploughed all round, and loose tongues inserted when laying. The blocks, previously baked, should be dipped into a kettle of tar to a depth of half their thickness, and quickly rubbed into position, a few taps with a hammer being given to consolidate them. The work should be commenced at the farthest corner from, and finished at, the doorway.

Architectural Lantern Slides for Lectures.

DARWEN.—SMIVILLE writes: "I should be glad to know where to obtain a series of slides to illustrate a lecture on architecture. I do not want any 'set' of slides—such as 'The Cathedrals of England'—as I propose to deal with the whole subject in a more or less sketchy manner, giving a few illustrations and details of each style, commencing with the Egyptian and concluding with a few good modern examples by various architects."

Mr. Stewart of 457 West Strand, W.C., could supply such a list of slides as is required, and would let them out on hire, allowing them to be selected as desired—that is, a few from one "set," and a few from another. It is, however, very difficult to obtain slides of details without having them specially made from photographs; but finely-executed pencil drawings made on ground glass, or on glass coated with "retouching medium," look very well when projected on the screen, having much the effect of crayon drawings. Of course the glass should be cut to the standard size for lantern slides, namely, 3¼in. by 3¼in. G. A. T. M.

Builders' Notes.

The Building Trade in St. Andrews has for some time past been at a complete standstill, but there are fairly good prospects for the ensuing year. New ground has been broken upon at the west end of the town within the area of the recently extended burgh boundary. The ground is being feud at a comparatively moderate rent—£18 per acre—and at the price villas of a smaller size than those erected upon the dearer feuing ground in the neighbourhood are to be built. It is understood there is a considerable demand for this class of house in St. Andrews, and the start given in this part of the town will in all probability be followed by others. The ground is extremely suitable for building purposes, being level and standing higher than the remainder of the town.

The Sunderland and District Building Trades Association held its annual dinner last week. Mr. J. W. White, president, was in the chair. Mr. W. Lowry, of Newcastle, in proposing "Success to the Sunderland Branch of the Northern Counties Federation of Building Trade Employers," said the building trade at present was in a very unsettled state. There was the unfortunate bricklayers' strike, and i seemed a pity that there were not some means of conciliation to bring to an end that deplorable dispute. The chairman, in reply, dealing with the brisk business of the past year, said that the advanced price of material and labour largely diminished the margin of profit when people thought it should be highest. He thought, however, that the limits of good trade had been reached and that they might look for a declining. Regarding the lock-out, he would advise both sides in the present dispute to keep cool.

London County Council.—At last week's meeting of the Council, the consideration of the proposal to rebuild Lambeth Bridge (see p. 354 of last week's issue) was adjourned in order to allow the Finance Committee to report upon the estimates of cost. The same committee recommended that a five-arched, granite-faced, concrete bridge should be built at a cost of £308,000. Upon the recommendation of the Main Drainage Committee, it was agreed to spend £22,330 on the drainage of Coldharbour, which lies between the two entrances to the West India Docks at Blackwall. The tender of Messrs. Clay, Henriques and Co., at £1,401, for the manufacture, delivery, and erection of nine penstocks required for the carrying out of the above work was accepted. The Council passed estimates of £120,000, £13,500, £7,000, £15,000, and £9,100 in respect of the paving and other works for the following improvements: Holborn to Strand Street, Southampton Row; Wandsworth Road, Lambeth, Kensington High Street, and Cat and Mutton Bridge, Shoreditch. The Council agreed to send a deputation to the Local Government Board on the subject of the water supply of the county.

The Newport (Mon.) Master Builders' Association held its annual banquet last week. Councillor John Linton, J.P., president of the association, took the chair. Over 100 members and friends sat down to dinner. Mr. A. S. Morgan, in proposing "The Town and Trade of Newport," regretted that trade was not quite so flourishing as they could wish. That was due, no doubt, to a large extent to the strike of last year, which did a great deal of harm. He believed, however, that more prosperous days for the town were ahead. During the past ten years the ratable value had increased by over £100,000. The Corporation had recently received Parliamentary powers to carry out works which would involve an expenditure of £300,000 or £400,000. The Alexandra Docks Company were asking for powers to make new works and extend the dock accommodation, which works, if carried through, would cost £750,000. Councillor T. Parry, J.P., who first responded, thought the condition of things, so far as the town was concerned, was not so much to be deplored. There were no empty houses, but on the contrary, a great demand for houses. Councillor W. M. Blackburn proposed "The Architects and Surveyors," and Mr. E. Fawckner and Mr. Swallwell responded.

Building Boom in Peterhead.—Work is now assured for those engaged in the building trades throughout the winter and spring months. After the disastrous nature of the herring fishing during the past two seasons it was thought that trade would be practically at a standstill in the town. The fishermen throughout the year have, however, on the whole, done well The ordinary tradespeople have up to now also been well employed with the completion of new buildings, and repairs and additions to existing houses, while a very large amount of work has been done in the laying of concrete pavements throughout the town. This, however, was only of the nature of temporary employment, and there was little hope for the winter till within some days ago, when things took a decided turn for the better. At present two houses—one in Seagate and the other in King Street—are in progress of erection, but plans for other four new houses have been passed by the Street Committee of the Town Council. These include a large block of offices to be erected at the harbour by the Feuars' Managers at a cost of about £2,000; a new house in Landale Road; two villas to be built at the north corner of Landale Road and Prince Street with frontage to Landale Road; and several plans of additions and alterations on houses.

R.I.B.A. NOVEMBER EXAMINATIONS.

Results.

WE give below the results of the November examinations held by the Royal Institute of British Architects.

The preliminary examinations, qualifying for registration as Probationer R.I.B.A., were held simultaneously in London, Birmingham, Bristol, Manchester, and York on November 6th and 7th. The examinations in the provinces were conducted by the allied societies of the respective centres. Of the 172 candidates admitted, 32 claims for exemption from sitting were allowed. The remaining 140 were examined, with the following results:—

	Examined.	Passed.	Relegated.
London	78	58	20
Birmingham	9	9	0
Bristol	11	7	4
Manchester	25	22	3
York	17	13	4
	140	109	31

The successful candidates, together with those exempted, making a total of 141 newly-registered

Probationers,

are as follows:—

A. W. Anderson (Horsham), A. Ashton (Rugby), G. T. Austin (Birmingham), W. T. McN. Barrett (Stoke-on-Trent), J. C. Beare (Stanmore), Baron W. R. Beaumont (Exeter), F. Bell (Manchester), H. Black (Hampstead), C. L. Blethyn (Cardiff), Annie W. Bradshaw (Bolton), J. E. Braithwaite (Leeds), C. H. Brightiff (Southampton), F. G. Brooker (Peckham Rye), C. F. H. Brookes (Eye, Peterborough), R. J. Buck (Horsham), H. W. Burchett (Brixton), C. L. Burns (Forest Row, Sussex), H. W. Cathie (East Sheen), E. Chaplin (Hove), A. W. Clapham (Beckenham), P. M. B. Collcutt (London), J. O. Cook (Plumstead), L. J. Coussmaker (Walthamstow), P. G. Crawley (Peterborough), T. E. Crompton (Petersfield), J. J. Crowe (Brentwood), L. Crowley (Portsmouth), J. Day (Wakefield), W. H. Evans (Southampton), H. J. Fairburn (London), G. A. Farrar (Huddersfield), C. Forsyth (Glasgow), R. C. Foster (Loughton), W. J. Freeman (Halifax), E. L. Frost (Anerley), N. H. T. Fuller (Taunton), A. H. Gadsdon (Chichester), R. M. Geater (Holloway), W. H. George (Cheltenham), W. H. Godfrey (Catford), G. H. Goldsmith (Cheshire), A. C. Goulder (Leytonstone), A. G. Greenwood (South Kensington), C. Groves (Chester-le-Street), A. W. Hall (Ealing), L. H. Harrington (Bromley), W. Harvey (London), D. P. Hayworth (London), C. J. Hazard (Boscombe), A. J. Healey (London), H. Healey (Didsbury), W. B. Hellard (Teddington), J. L. Henderson (Edinburgh), F. Higginbottom (Withington, Manchester), E. F. Hill (Winchester), R. M. Hilton (Wimbledon), C. V. Hodges (Leicester), S. R. Hollingdale (Bayswater), J. B. Holt (Levenshulme), P. B. M. Hope (Perth), C. E. Howitt (Nottingham), H. Hunnisett (Rye), D. B. Hutton (Glasgow), W. H. Hyde (Nailsworth, Stroud), A. L. Iredale (Stroud), J. P. Irvine (Lincoln), J. W. Jarvis (Moseley), H. F. Keighley (Moss Side, Manchester), A. H. Laister (Wakefield), W. B. Lates (Birmingham), W. Leahy (Yeovil), G. Leresche (Manchester), T. C. Little (Longtown, Cumberland), R. A. Loveitt (Coventry), A. S. W. Mackay (Carlisle), W. K. McDermott (Borough Green, Kent), R. B. Medcalf (Aughton, Ormskirk), R. Mercer (Great Harwood, Blackburn), S. Moss (Eccles), G. E. Moxon (Barnsley), S. H. J. Murch (Loughton), A. F. Murray (London), J. R. Musto (London), G. V. Myer (London), F. G. Newton (London), F. Nicholls (Whipps Cross, Leyton), F. A. C. Old (London), G. M. Owen (Birkenhead), B. C. Page (Tonbridge), J. Page (South Lowestoft), H. J. Parr (Brixton), W. E. Paterson (Cheltenham), A. E. S. Payne (New Cross), J. H. Pearson (Balham, London, S.W.), W. A. S. Pettit (Balham, London, S.W.), W. H. Pickard (Whitchurch, Salop), J. Plottel (Middlesbrough), H. A. Porter (Gravesend), C. H. Potter (Matlock Bridge), G. A. Potts (Manchester), A. F. Potts (Leytonstone), W. Pyper (Cults-by-Aber-

deen), L. G. Rayner (Gravesend), C. A. Reed (Clapham), T. H. Rhodes (Leeds), A. S. Robertson (Perth), D. G. Round (Sutton), J. A. Ryan (London), H. Savage (St. Albans), D. G. J. Saw (Green Lanes, London, N.), H. S. Sawyer (Winchester), J. H. Sayner (Harrogate), H. S. Scott (Handsworth, Birmingham), H. E. Seccombe (Clapham Common), W. C. B. Sinclair (Bexley), B. C. Smith (Caversham), H. S. Smith (Manchester), H. Solomon (Haulgh, Bolton), P. H. Solon (Stoke-on-Trent), S. M. Spoor (East Putney), W. Stockdale (North Shields), E. A. Sudbury (Nottingham), F. Sykes (Kendal), R. J. Tall (Gravesend), T. T. Tallon (Bolton), H. F. Tasker (Hampstead), B. W. Thomas (Southampton), T. Thorne (Brockley), J. E. Tindall (Lavender Hill, London, S.W.), W. Turpin (Roker, Sunderland), H. Unwin (Bolton), F. Wade (Frizinghall, Bradford), F. A. Walker (Hampstead), P. Weston (Sheffield), N. C. Wetherilt (South Hampstead), O. White (Barton-under-Needwood, Burton-on-Trent), E. C. M. Willmott (Roath, Cardiff), A. W. Wilson (Peterborough), R. Wilson (Sheffield), J. L. Worssell (Regent's Park, London), R. Wylie (Gateshead-on-Tyne).

Students.

The intermediate examination, qualifying for registration as Student R.I.B.A., was held in London and the various provincial centres named below on November 6th, 7th, and 8th. The examinations in the provinces were conducted by the allied societies of the respective ditsricts. Fifty-nine candidates were examined, the results being as follows:—

	Total Examined.	Passed.	Relegated.
London	45	29	16
Bristol	6	2	4
Manchester	8	4	4
	59	35	24

The successful candidates are as follows, the names being given in order of merit:—

A. J. Hope (Atherton, Manchester), E. L. Gaunt (Ilkley), W. E. Dobson (West Hampstead), D. L. Allen (Dundee), H. A. Hall (Hastings), H. J. B. Hoskins (Birmingham), A. J. Taylor (Bath), F. Haswell (North Shields), T. W. Whipp (Scarborough), H. Prince (Bayswater), S. C. Stephens (Hockley, Birmingham), O. P. Milne (Bedford), W. R. Davidge (London, S.W.), N. C. Smith (London), E. J. Dixon (Stratford), A. R. Gradwell (Blackburn), V. Hooper (Redhill), J. G. Wilson (London, W.), J. H. de C. Ballardie (London), G. B. H. Hoole (Highgate), G. H. Lovegrove (Herne Hill), M. N. Castello (London), J. J. S. Naylor (Bayswater), R. Bennett (Buxton), C. E. L. Parkinson (Kennington), B. C. Chilwell (Wednesbury), A. C. Notley (London), H. F. Clarke (Pendleton, Manchester), L. Leeper (Great Yarmouth), F. A. Ling (Mitcham), A. A. Midwinter (London), W. B. Rees (Cardiff), C. E. B. Sutton (Warrington), C. R. Thickpenny (Bournemouth), F. E. Tomson (King's Norton).

Associates.

The Final and Special Examinations, qualifying for candidature as Associate, R.I.B.A., were held in London from November 16th to 23rd. Of the 51 candidates examined, 26 passed, and the remaining 25 were relegated to their studies. The successful candidates are as follows:—

T. B. Ball (Weston-super-Mare), E. W. Banfield (Camberwell), G. Brumell, jun. (Morpeth), H. M. Cautley (Westminster), *W. G. Cogswell (Wallasey, Chester), *W. E. F. Crook (London), H. A. Douglass (Brighton), T. W. Gordon (Nottingham), A. H. Goslett (Great Stanmore), S. Harrison (Leicester), *C. E. Hutchinson (London), A. L. MacGibbon (Edinburgh), R. H. J. Mayhew (Anerley), W. V. Morgan (Carmarthen), R. W. Owen (Waterloo, Liverpool), A. W. Papworth (Maida Hill, London), J. Quail (Leamington Spa), F. J. O. Smith (Westminster), E. J. Tench (Cambridge), C. B. Thomas (London), N. Thorp (Clapham), *H. A. Tinker (Kensington), P. J. Turner (Stowmarket), W. J. Walford (Anerley), R. D. Wells (London), E. P. Wheeler (Chelsea).

[* These candidates were admitted to the Special Examination, under the following regulation:—"Architects in practice not less than twenty-five years of age, and chief assistants over thirty years of age, who desire to be admitted as Associates, can be exempted from passing the Preliminary and Intermediate Examinations and in sending in Testimonies of Study. They can be admitted, by resolution of the Council from each case, to a Qualifying Examination (namely, the Final of the three examinations), which is conducted with especial regard to the requirements of such architects, their professional works and position being duly taken into account by the Board of Examiners."]

The following table shows the number of failures in each subject of the Final and Special Examinations:—

I. Design	24
II. Mouldings and Ornament	10
III. Building Materials	5
IV. Principles of Hygiene	1
V. Specifications	4
VI. Construction: Foundations, &c.	3
VII. Construction: Iron and Steel, &c.	3

Ashpitel Prize, 1900.

This prize has been awarded to Mr. Shirley Harrison, and extra prizes of five guineas each to Mr. C. H. F. Comyn and Mr. C. E. Varndell.

Quarry Notes.

A Monument to the Gordon Highlanders who fell during the Indian frontier fight from 1892–8 has been unveiled in the Duthie Park, Aberdeen. The memorial was erected by the contractors, Messrs. Henderson and Webster, granite merchants. It takes the form of an obelisk rising above a circular form about 7 feet in diameter and two triangular bases. At the top of the column there is the allegorical figure of Victory, in bronze. The total height of the memorial is about 20 feet. On the face of the column the names of those who fell in action or died of wounds are inscribed—about 100 altogether.

Prices of Slates for next Year.—The Slate Quarry Owners' Association have been discussing the list of prices for the ensuing year, and advances have been made in certain sizes and qualities, whilst small reductions have been made in others. Taken on an average, the prices for next year will be a trifle higher than those which at present rule. Much is expected from South Africa after the war. For some years past Festiniog slates have been shipped to Cape Town and Delagoa Bay, and there is every reason to believe that a still larger business with the colonies will be done. Fewer American slates have been imported than used to be the case; but we cannot say whether the slump in American and Continental production will continue. It may be said, however, that the influence of American slates on the market has been reduced.

Aberdeen Granite Trade.—The Aberdeen harbour returns dealing with the granite trade for the past twelve months show that last year 10,213 tons of foreign granite were received at Aberdeen, while this year the amount was 11,861, showing an increase of 1,648 tons. In regard to the quantity of granite of all kinds exported from Aberdeen during the past twelve months to various parts of the world, the harbour returns show that, while the total number of tons shipped in 1899 was 56,449, this year the figure stands at 54,854, a decrease of 1,585 tons. Of kerbing, paving and building stone, this year 4,725 were shipped, an increase of 92 tons. In rubble and chips there is a great falling off; during 1899 the number of tons being 11,180, and this year only 8,112 tons shipped, a decrease of 3,068 tons. The export of polished granite has also diminished, though only slightly; in 1899 the quantity being 9,590 tons, and in 1900, 9,485 tons, a decrease of 105 tons. Granite waste slabs for paving show a large increase, 4,184 tons having been shipped this year as against 2,062 tons last.

A new Warehouse at Glasgow is being erected on a large square site, with frontage to Buchanan Street, Argyle Street, and Mitchell Street, the principal elevations being in the two first-mentioned thoroughfares. The walls are of grey sandstone, and the expanse of front is agreeably broken by projecting balconies of Aberdeen granite from the quarries of Messrs. Macdonald & Co. (Limited), Aberdeen. One of the Argyle Street entrances has also a 9-ft. granite Hercules on each side. The building is being erected in sections so as to gradually replace the present premises of Messrs. Stewart & Macdonald (Limited), warehousemen, whose business it is intended to accommodate. When completed the warehouse will probably be the largest of its kind in Great Britain, as it will have a floorage of 235,000 sq. ft. The architect is Mr. Horatio K. Bromhead, A.R.I.B.A. A notable street improvement is being effected in connection with the new building, one side of the narrow-necked entrance to Buchanan Street from Argyle Street being removed by the line of the building being set back about seven feet, this having been done under arrangement with the Corporation, who paid £8,000 for the concession.

Engineering Notes.

Gwynfryn Wesleyan Chapel, Flint, has lately been fitted with the latest improved "Small Tube" hot-water heating apparatus by Messrs. John King, Ltd., engineers, of Liverpool.

A Proposed New Bridge across the Swale.—The directors of the South-Eastern and Chatham and Dover Railway Companies have decided to apply to Parliament for powers to construct a new bridge across the Swale, an arm of the sea which divides the Isle of Sheppey from the mainland of Kent.

Water Supply in India.—At a meeting of the East India Association held last week Mr. William Sowerby brought forward a project for supplying water in India during times of drought on the partial or complete failure of the monsoon rains. Considerable quantities of water, he thought, could most undoubtedly be obtained in almost every part of India by means of deep but inexpensive artesian tube wells. He calculated that twenty wells, sufficient to supply nearly 150,000 persons and their cattle, could be made for £10,565, including cost of boring apparatus, engine power, buildings, and supervision. Large supplies, again, could be secured by means of accumulating and compensating reservoirs constructed in the valleys of the great rivers. A tank holding 6½ million gallons of water, sufficient to supply 1,000 people with 25 gals. a day each for 260 days, he estimated could be constructed for £605.

The Lift Accident at Marylebone Station of the Great Central Railway has been reported upon to the Board of Trade. The report states that as the lift, containing six men, a truck, and eight chests of tea, was being lowered from the second floor of the warehouse, it suddenly descended rapidly to the basement. The men were severely injured and the cage was somewhat damaged. The primary cause of the accident appears to have been the breakage of the top pulley wheel. As far as can be ascertained no exceptional strain had been put upon the pulley wheel to cause the breakage. There is, therefore, no doubt that an increase in the strength of the pulley wheels is called for. From this accident it certainly appears that it is possible for a cage to fall sufficiently rapidly to cause serious injuries to its occupants while the suspension rope is in sufficient tension to prevent the safety clutches from acting.

Tewkesbury Abbey.—This is without doubt one of the most historically interesting abbeys in England. The greater part of it was built during the reign of King Henry I., in the earliest quarter of the twelfth century. The west front is principally occupied by a lofty receding arch; a treatment of a façade similar to that of Lincoln and Peterborough, though rather the exception than the rule in English cathedral architecture. The nave and aisles have the same style of simple grandeur as those at Peterborough, Durham, Gloucester, &c. The abbey abounds in beautiful monuments and monumental stained glass. The south side is generally of more interest than the north, for here the cloisters are situated as a rule. The cloisters at Tewkesbury were, however, destroyed at the time of the dissolution of the monasteries. The springing of the fan vaulting is still visible on the external walls. The illustration on the opposite page is from a drawing by Mr. W. Lee Clarke.

Professional Practice.

Doncaster.—The new workhouse at Balby, near Doncaster, erected by the Doncaster Board of Guardians for the Union of Doncaster, has been opened. The buildings, which have cost about £100,000, are the most unique in the kingdom, having all the latest improvements and being brought up to the most recent demands of the Local Government Board. The Government Inspector has expressed the opinion that the Doncaster Workhouse was the best that exists, and the Emperor of Russia has asked for plans of the building in order that they may erect buildings of the kind in their own country. The buildings are situated near Balby, and the site comprises about 30 acres, which provides ample space for future extension, the accommodation of the new buildings being for 600. The administrative portion of the buildings, such as stores, laundry, boiler-rooms, officers' rooms, bath-rooms, lavatories, and offices. The laundry and boiler-house buildings are placed in a central position between the main building, lunacy blocks and infirmary, and consist of the laundry, containing warehouse, ironing-room, drying-room, wash-house, receiving and distributing rooms, and head laundress's office. The boiler-house has space for three boilers, and in close proximity to it is the electric light house, with dynamo and accumulator rooms, the workshops, coal-house, and water tower. The infirmary is in the S.W. portion of the site, and is a complete building in itself, consisting of a central building, from which corridors to the left and right lead to the male and female pavilions, which are divided up into wards for the various class of sick. The nurses' homes occupy the central building, and contain nurses' bedrooms, sitting, recreation rooms, &c., doctor's surgery, and dispensary. The front of the infirmary wards face the south. All the walls of the wards are and mortuary. It is situated in a remote position to the north of the main building. The aged married couples' cottages are on the south side of the main building, and are entirely separate from it. Each of the cottages will have pleasant gardens, with a light metal palisading fronting them. The elevations have been designed with little ornament, and what there is is chiefly concentrated on the administrative buildings, proportion being studied more than ornament for effect. The buildings are faced with Nostell bricks and stone dressings, with slated roofs. The corridors and wards in the main buildings have dadoes of salt-glazed bricks, whilst the kitchens and sanitary offices are of cream glazed bricks. The lighting throughout is by electricity. The system of drainage is a simple one, and on the most approved plan. The contractors for the whole of the work have been Messrs. Harold Arnold and Son, of Doncaster, the architect being Mr. J. H. Morton, F.R.I.B.A., of South Shields. The

house, however, have been designed large enough for future extension. The buildings consist of six groups, namely: entrance building, main building, laundry and boiler-house building, infirmary, lunacy building, and isolation hospital. The entrance building, through the archway of which is the principal approach to the buildings, contains porter's accommodation, receiving wards and vagrant wards (vagrants of both sexes are provided for, principally on the cellular system). In this building are also rooms in which to store the clothing of the inmates when taken from them on leaving the receiving wards for their respective places in the workhouse. The workhouse proper, or main building, is in the centre, in the front of which are the committee-room, business offices, and master's house, and in the rear of these the dining-hall (a handsome apartment, with an open timbered roof), kitchen lighted from the roof, and fitted up with all the latest appliances, scullery, work-rooms, matron's office and stores, bakery, and flour store. Upon each side of the administrative blocks, and connected by corridors, are the pavilions for the male and female, aged and able-bodied classes, with the necessary day-of hard, impervious plaster, with glazed brick dadoes of light colour; the lavatories, w.c.'s, &c., are lined with glazed bricks, the incidental arrangements being of the latest hygienic pattern. All the internal angles of walls and between walls and ceilings, walls and floors, are quadrants; projections or mouldings are absolutely dispensed with, so that there may be no lodgment of dust, and every part of the building may be swept and kept clean. The heating of the large infirmary wards is by hot water and by means of central stoves faced with faïence, with horizontal flues in the thickness of the floors, which are supplied with fresh air direct from the outside. When warm these flues distribute the heat evenly through the buildings. The maternity block is in a convenient and quiet position in the rear of the infirmary. The lunacy buildings occupy a similar position to the infirmary, but in the S.E. portion of the site, and provide accommodation for imbeciles, epileptics, and short-period lunatics. The buildings contain wards for the different classes, and padded and attendants' rooms for both sexes. The isolation hospital is a complete building in itself, and has its own nurses' accommodation, washhouse, principal sub-contractors have been Messrs. Benham and Sons, Limited, of London, for the principal portion of the engineering; the Keighley Electrical Engineering Company, Limited, for the electric lighting; and Messrs. Dinning and Cooke, of Newcastle-on-Tyne, the heating. Mr. R. M. Robertson has acted as clerk of works.

Hull.—The foundation stone of new Board Schools which are to be erected in Holland Street, Hull, at an estimated cost of £17,000, was laid recently. These schools are the first of four new schools to be erected by the Board, and in each case the Central Hall scheme will be adopted. The principal building in the new schools will be a two-storey mixed school, the upper floor of which will be set apart for the seniors and the ground floor for the juniors. The central hall will be 55ft. by 32ft., and it will be surrounded on three sides by class-rooms. These number eight, and all of them open into the hall by means of a corridor. Six of the class-rooms will accommodate sixty children each and the other two fifty each. Swing doors will be fixed at both ends of the corridor, which abut out on to

the outer part of the corridor, from which access is obtained to the cloak-rooms and lavatories. Beyond this are to be entrances and staircases, the girls at one end and the boys at the other. The infant school is to be a separate one-storey building, planned on the same central hall system, surrounded by five class-rooms, four of which will accommodate sixty children each, and the fifth fifty, with a gallery. In each school ample accommodation has been provided in the way of teachers'-rooms, cloak-rooms, &c. Behind the main block a separate two-storied building will be set apart for the teaching of cookery and laundry work. The cookery class-room is to be 32ft. long and 25ft. wide, and the laundry-room will be the same size. Covered playgrounds are provided for each school. It is proposed to adopt a combined system of heating and ventilation. The heating of the buildings will be by low-pressure steam, and fresh air will be admitted by means of ventilating radiators, whilst the foul air is extracted chiefly through "risers," which communicate with the main extract shaft beneath the floor, leading to a vertical extract shaft at the end of the building, which will form an attractive feature. The exterior of the building will be of red bricks. Mr. J. Bilson is the architect; Messrs. Hockney and Liggins, of Hull, are the contractors; and Messrs. Ashwell and Nesbitt, of London, are responsible for the heating apparatus.

London, S.W.—The New Grand Music Hall at Clapham Junction, standing on an ideal site on St. John's Hill, was recently opened. The architect is Mr. Ernest A. E. Woodrow, A.R.I.B.A., who also designed the Camberwell, Collins's, and other halls. The style is a simple treatment of Renaissance in red brick and red stone. On either side of the entrances to the grand vestibule two projecting turrets rise about 80 ft. above the pavement level. At each of the two angles of the building are the wide public staircases. The dressing-rooms for the artistes are fitted up with every accommodation. A special feature has been made of the sanitary arrangements. The vestibule, with its marble steps, mosaic floor, and richly-decorated walls and ceilings, is a feature of the hall. The rake of the first floor is such as to afford persons at the back of the auditorium a good view of the stage; whilst the level of the pit ceiling is so arranged as not to curtail the range of vision in any way. The circle and gallery are constructed on the cantilever principle, there being no columns to obstruct the view of the stage. The interior decorations are gold, with various shades of cream. By an elaborate system of ventilation and a sliding roof, the temperature of the house is regulated, avoiding all vitiation and draughts. Special precautions have been taken against fire by asbestos and non-flammable wood. There is an electric-lighting plant at the rear of the hall. The holding capacity of the house is estimated at from 2,500 to 3,000. The stage is 68 ft. wide by 28 ft. deep from the floor, and 53 ft. in height from the stage door to the gridiron. The act drop and scenery is the handiwork of Mr. Francis H. Bull. The hall was built by Mr. C. Gray Hill, of Coventry, who erected the Camberwell Palace and other similar places. The following other firms were engaged on the work:—Electrical engineering, Messrs. Geipel and Lange, under the supervision of Messrs. Handcock and Dykes, Victoria Street; upholstery, Messrs. Lazarus and Messrs. Lyons; steel work, Messrs. R. Moreland and Son; decorations, Messrs. Campbell Smith and Co.

Nottingham.—The Jubilee wing of the Nottingham General Hospital, which the city and county of Nottingham have shared in erecting as a permanent memorial of Her Majesty's Diamond Jubilee, is now completed. The plans were by Messrs. Alfred Waterhouse, R.A., & Son, based largely upon a similar building recently erected by them at Liverpool. The wing is so constructed as to secure simplicity in administration. The new wards are airy, well heated, and well ventilated. The main feature is the series of three circular wards, one above the other, which are attached by a block of small wards to the north-east end of the existing long corridor, and extend in a south-easterly direction along the frontage to Postern Street. The erection necessitated the rearrangement and displacement of the old staircase, and the new wards are reached by a corridor 81ft. long, which is situated at right angles to the main corridor of the older portion. The main block is five storeys, or 72ft., high, and the three upper storeys, consisting of the ground, first and second floors, are to be used for patients' beds. The upper basement is set apart for the use of the servants, while the sub-basement is devoted to the staff of porters, in which are situated a series of sitting-rooms and bedrooms, together with a store-room, and there is also an exit, through which, by means of a new road, the new laundry which is being erected on Standard Hill may be reached. The upper basement is constructed upon much the same plan, and will accommodate 22 of the servants, for whom an extensive chamber is to be converted into cubicles for sleeping. Each of the three circular wards will contain beds for 18 patients. They have a diameter externally of 60ft. and internally of 54ft., and are 14ft. high, while 1,800 cubic feet of air are secured for each patient. There is a window between all the beds, except in two interspaces, one of which is occupied by the entrance door and the other by the gangway leading to the sanitary tower. This tower, like the main block, is five storeys high, containing on each of the three upper storeys a bathroom for patients, distinct sanitary accommodation for the nurses and patients, a housemaid's closet, a small room for clinical investigation, and a specimen room. Bathrooms are also provided in the two basements. The tower is cut off from the wards by means of bridges, with the usual methods of cross ventilation. The same principle is adopted at the junction of the smaller wards with the main building, a bridge 16ft. long separating the two on either floor. The portion of the extension which immediately adjoins the existing structure contains smaller rooms placed on each side of the corridor. On the right there are two wards, providing accommodation for two patients each, and on the left the necessary adjuncts of the larger wards, sculleries, larders, a small kitchen, stores for clothes, and comfortable apartments for the sisters. The new staircase, with a faïence dado, encloses a large passenger lift, capable of carrying a recumbent patient. The roof of the circular wards has been made flat: it is covered with an impervious paving, and is to be used as a promenade; while shelters and seats are arranged around the chimney stack which runs up the centre of the entire block, and serves also as a ventilating shaft. By an ingenious arrangement a further platform has been constructed round the stack, at a higher altitude, whence it is possible to obtain a view over the roof of the old hospital. The roof is reached by an independent staircase, to which access is obtained from each of the connecting bridges. Balconies have also been erected on the sunny side of the bridges of communication on each floor, where beds can be placed if desired. The whole of the wards are lined with glazed bricks, and the floors are fireproof, constructed as they are of steel joists encased in concrete. In all the wards the floors are covered with polished teak, while the corridors are paved with terrazzo, and lined with glazed bricks and plaster. Externally the walls of the new buildings are constructed and faced with red brickwork, relieved in the strings, dressings and cornices with Ancaster stone. Electricity is the sole illuminant throughout the Jubilee wing, and the heating is by the atmospheric system, though each of the circular wards is provided in addition with two fire-places. The extension altogether gives accommodation for 66 more patients. The new laundry buildings are situated on Standard Hill, and include, in addition to the laundry, drying and ironing rooms and boiler house, the boilers in which are intended also to supply the steam and hot water for the Jubilee wing. The laundry is fitted up with machinery of the most recent type. Mr. G. Reed has acted as clerk of the works. The contract for the superstructure was let to Mr. Woodsend, of Nottingham. The cost has been about £30,000.

Oldham.—New central premises have been erected for the Oldham Equitable Co-operative Society, at a cost of about £50,000. The educational department has a separate entrance, and contains a spacious newsroom and lending and reference libraries, conversation room, special room for ladies, and committee room. The two halls are approached by staircases of ample width and of easy access. The large hall will seat about 1,000 persons; a commodious platform is erected at one end seating eighty. The smaller hall will accommodate about 500 persons sitting, and for tea party purposes will seat 250. Two cloak-rooms are placed in convenient positions, and special kitchen accommodation is provided for the use of parties hiring either of these halls. The basement of the building fronting Greenwood Street contains the steam boilers, electric engines, and dynamos. These boilers were made by the Oldham Boiler Works Company, and provide steam to drive the electric engines and dynamos, made by Messrs. W. B. Haigh and Company—the latter firm having in hand all the electric lighting and power required for the buildings, under the supervision of Messrs. Crew and Handford. The front portion of the building is carried out in granite to the ground floor, and ashlar above. The buildings in Dunkerley and Greenwood Streets are faced with Accrington bricks, with stone strings, sills, &c. The work has being carried out by the following contractors:— Mr. James Brierley, excavator, &c.; Messrs. Ogden Brothers, brickwork and concreting; Messrs. S. and J. Whitehead, masonry; Mr. William Lees, joiners' work and fittings; Mr. Joseph Jackson, slater; Messrs. R. Chadwick and Sons, plumbers; Mr. James Hall, plasterer; Messrs. Dorman, Long, and Co., girders, &c.; Messrs. Heenan and Froude, steel roofs; Messrs. John Hall and Sons, gutters and castings; Messrs. E. Green and Co., Ltd., economisers; Messrs. Kirkpatrick Brothers, granite work; Mr. Alfred Whitehead, tiling; Mr. J. W. Hindshaw, fibrous plaster, &c.; Messrs. Homan and Rodgers, quartz floors, &c.; Mr. R. H. Lowe, wood blocking; Messrs. C. Schofield and Co., fittings; Mr. F. G. Floyd, stone carving; Messrs. J. and W. Guthrie, stained glazing; Messrs. Jackson and Ogden, electric lifts; Mr. James Heptonstall, tea tables, &c.; Messrs. Parker and Co., lightning conductor. Mr. Thomas Taylor was the architect.

Peterhead.—The Parish Home, which was initiated in the beginning of 1897 by the Parish Council of Peterhead as a commemoration of the Queen's Jubilee, has now been completed. The Home is built on the site of the former lodging-house. It has been built from plans prepared by Mr. Arthur Clyne, architect, Aberdeen, and at a cost of about £3,000, exclusive of furnishings. Provision is meantime made for 42 beds, as compared with 25 beds in the old building; and as this gives 600 cubic feet of space to each inmate it will at once be seen that the first thing that has been studied has been the comfort of the inmates. The Home has a frontage to King Street of 108ft. It is two storeys high, with projecting wings at each side, extending backwards 55ft., and a back wing of 70ft., while the width of the main building is 20ft. The home is divided into three sections, in order mainly to secure the better classification of the inmates, the east wing being reserved for the male inmates, the west wing for the female inmates, and the centre part for the governor and matron, the kitchen, dining-room, stores, and other domestic conveniences. The main entrance is in the centre of the front block. On one side of the main lobby is the committee-room, and in the other side the governor and matron's private parlour. Along the entire length of the south portion of the main building is a long passage, by which access is got to the various apartments. On the right and left are large day-rooms for the use of the male and female inmates, while in the end wings are rooms and dormitories for aged couples, probationary wards, and complete bathroom and lavatory accommodation. In the central back wing is a hall 24ft. by 19ft., which is to be used for serving meals to the inmates, and on Sundays for religious services. In this wing also is a large kitchen, scullery, pantry, larder

and numerous store-rooms. The second floor is set apart exclusively as dormitories, the males being on the east side and the females on the west, access being got by a staircase on either side of the building. It has been considered prudent not to have too large sleeping-rooms, in order to give a better measure of privacy to the inmates. As a rule three or five beds are all that are put into each, and the space between each cot is to be laid with loose carpeting, and the rooms made as comfortable as possible. A long, wide passage also runs along the south portion of the second floor, well lighted with large windows at either end, by which also good ventilation is got. In connection with either section are also sick and convalescent wards, and, as on the ground floor, complete bathroom and lavatory accommodation. The governor and matron's apartments are in the centre of the building, which is reached by a staircase for their exclusive use and the use of visitors. On the top of the main building and the back wing are large drying lofts. There are fire-places in all the apartments, but the building throughout is heated with hot-water pipes, while there is also hot and cold water circulation to the bathrooms and lavatories. At the rear of the building airing grounds are divided off for the two sexes, while along the south wall are a row of out-houses. These include the washing house and laundry, fitted up with the latest appliances, also workshop for the men and boys, and a mortuary and post-mortem room with the necessary requisites for conducting examinations.

Tregare.—The picturesque little fourteenth-century Parish Church of Tregare, near Raglan, has been reopened after undergoing repair for several months. There are few, if any, old parish churches in this neighbourhood possessing so fine an example of ancient half-timber work as may be seen in the south porch of this church, where it has been necessary to replace the old oak with but little new. The old nave roof has been made secure, and its stone tiles repegged on strong oak battens. The stone tiles on the tower roof, which had become a source of danger to passers-by, have also been rehung and the oak timbers repaired. The tower does not form a part of the early fabric, but was added during the seventeenth century, the fourteenth-century west window doing duty for a tower arch. One of the most interesting features in the church is the rood stair. The chancel arch is also of a most unusual character, taking the form of a cinquefoil above a pointed arch. A new carved teak pulpit on a stone base is the only new addition; all else has simply been a work of reparation. The work has been carried out under the direction of Mr. G. E. Halliday, F.R.I.B.A., the Diocesan Surveyor for Llandaff.

Usk.—St. Mary's Church has recentiy been reopened after undergoing reparation. The organ, until recently in use at Llandaff Cathedral, has also been cleaned, rebuilt, and tuned by Messrs. Vowles, organ builders, of Bristol. The Priory Church of Usk carries us back to the days of "Strongbow," or Richard de Clare, of the 12th century, who founded a priory for five Benedictine nuns at Usk. The Priory Church has during successive ages been the scene of such continuous demolition that now, with the exception of the Norman tower, very few traces of the early foundation remain. Succeeding ages have, however, left their mark on the nave, aisles, and porches, which form a study of 13th, 14th, and 15th-century architecture. The work now completed has been that of simple reparation. The fine 13th-century arcade has been freed of its coating of cement plaster and sham mouldings. The Norman work of the crossing has been exposed. The plaster ceiling has given place to well-designed oak barrel roofs with carved and gilded bosses. The window tracery has been restored and reglazed, and in fact the old church, or so much of it as now remains, seems to be rejuvenated to its Middle Age or 15th-century period. The entire reparation has been carried out under the direction of Mr. Halliday, F.R.I.B.A. Messrs. George Couzens and Co. were the contractors for the roofs, stalls, &c. The work has cost about £1,200.

Law Cases.

Letting Uncertificated Houses: Offences against the Birkenhead Laws.—William Hugh Edwards, builder, was summoned recently under the building by-laws for having let Nos. 89 and 97 Maybank Road, Birkenhead, without having first obtained a certificate from the surveyor as to the fitness of the same for habitation.—Defendant had recently erected the two houses referred to, and applied for certificates of fitness for occupation, which were refused on the ground that the houses were not properly completed. A second application had the same result, and on a third request for a certificate being made the premises were found completed, and had been occupied for some time. The scullery ceilings were not the proper height required by the by-laws, the sink waste-pipes were not provided with "shoes," and did not deliver on to the gulleys. The holes through which the pipes were passed had not been properly stopped up.—Defendant said he had not the least intention of breaking the by-laws.—The bench imposed a fine of 20s. and costs in each case, £2 13s. in all.

Government Contracts: the Meaning of the Word "Required."—In delivering judgment last week in the appeal case of *Stewards and Company, Limited*, v. *The Queen*, the Master of the Rolls said that this was a petition of right, in which the suppliants asked for damages for breach of contract on the part of the Crown. The sole question was as to the meaning of the word "required" in a letter from the Admiralty to the suppliants. The Admiralty wanted stone for the construction of a new breakwater, and they invited tenders for the supply of cap and roach stone in such quantities as might be required by them. The suppliants, who were stone merchants, sent in a tender, stating that they agreed to deliver cap and roach stone, approximate amount 2,000,000 tons, in accordance with specification, for the sum of 4d. per ton. That was an offer, and it was accepted by a letter from the Admiralty, stating that the suppliants' tender was accepted for the supply for the new breakwater at Portland of about 2,000,000 tons, or such quantity as might be required, of cap and roach stone, in accordance with specification. In his opinion, that meant for the supply of approximately 2,000,000 tons, or such quantity, either a little more or a little less than 2,000,000 tons, as might be required for the construction of the breakwater. He thought that the view of the Crown, that this was a contract under which one side was bound and the other was free, was unbusiness-like. He, therefore, thought that the appeal should be dismissed. Lord Justice Collins said that he did not take such a clear view of this case as the Master of the Rolls did, but he did not differ. He thought that, having regard to the fact that the Admiralty might think it their duty not to incur unnecessary expenditure, and also to the fact that the stone in question was refuse stone which the suppliants might be glad to get rid of, there were two possible views as to the true construction of the contract in question, and that either view might give a not unreasonable contract. On the whole, however, he thought that the more reasonable and the better view was that adopted by the Master of the Rolls. He therefore agreed that the appeal should be dismissed. Lord Justice Stirling thought that the contract was capable of two meanings, but, having regard to all the documents, he was of opinion that the view taken by the learned Judge at the trial and by the Master of the Rolls was right.

A Case relating to Fees for Measuring-up Work.—In the case of *Do lar* v. *Higgs and another*, heard last Friday in the Queen's Bench Division of the High Court of Justice, the plaintiff, Mr. Peter Dollar, architect and surveyor, sued Messrs. H. and H. F. Higgs, builders and contractors, for £262, money alleged to have been received by the defendants for the use of the plaintiff. The case was heard in May last before the Lord Chief Justice and a special jury, when the jury disagreed. It appeared that the plaintiff was employed in 1897 by Messrs. Pickford and Co., the well-known carriers, to prepare plans and specifications of certain stables which were subsequently erected at Tottenham. Tenders were invited for the work upon a schedule of prices. The defendants' tender was accepted, and they did the work, which was completed in October, 1897. The work was then measured up by a nominee of the defendants in conjunction with a clerk in the plaintiff's office named Preston. Before the measuring up was completed Preston left the plaintiff's service, and the plaintiff employed Mr. R. S. Wardle to complete the measuring up. Wardle was a quantity surveyor, having a separate office, who had from time to time been employed by the plaintiff when there was more work to do in the plaintiff's office than his staff could cope with. According to the plaintiff's case Wardle was employed upon the Tottenham job on the terms of receiving one-third of the plaintiff's commission. Notwithstanding this arrangement, which the plaintiff alleged was known to the defendants, the defendants, when they received the final remittance from Messrs. Pickford and Co., paid over to Wardle a sum of £262, being 2½ per cent. of the amount of the contract, which was included in Messrs. Pickford's remittance as surveyors' fees for measuring and making up accounts. The plaintiff's case was that in the course of a conversation between himself and one of the defendants, which took place before the above payment was made, the plaintiff stated that the fees for measuring up the work were payable to himself, and that Wardle was not an independent surveyor and had no authority to receive the fees. It was suggested that the defendants in paying the fees to Wardle were influenced by disputes which had arisen between them and the plaintiff relative to the plaintiff's certificate as architect. The defendants denied ever having had any intimation from the plaintiff that Mr. Wardle was not an independent surveyor, and their case was that they were justified in so regarding him. It was suggested on behalf of the defendants in the cross-examination of the plaintiff, but denied by the latter, that the receipt of the quantity surveyor's fees by the plaintiff was unknown to Messrs. Pickford and Co., and was in the nature of a secret commission. Mr. Justice Wills, in the course of his summing up, said that no one disapproved more strongly than himself of the taking of secret commissions, but he was convinced that the observations which had been made against that practice had no application to the present case. The jury found a verdict for the plaintiff. Judgment was accordingly entered for £175, credit being given for one-third of the fees which was admittedly payable to Wardle.

House Property: An Unsuccessful Claim for Damages.—On December 3rd, in the Queen's Bench Division of the High Court of Justice, the case of *Greswolde-Williams and others* v. *Barneby* was heard before Mr. Justice Wills and a special jury. This was an action brought by Mr. F. W. G. Greswolde-Williams and his trustee against Mr. W. H. Barneby, the defendant, for damages for breach of warranty in the sale of a house and land. Plaintiffs' counsel said that on July 26th, 1898, plaintiffs bought for £30,000, at a sale at Token-house Yard, a house called Bredenbury Court, in the county of Hereford, together with about 530 acres of land. The particulars of the sale of the property contained the following provisions: "The house is in first-class order throughout, not the slightest outlay being needed before occupation," and "the sanitary arrangements were thoroughly overhauled and reconstructed in 1894-95 under the supervision of the Gloucester Sanitary Association, and the drainage is carried by a good fall to 500 yds. away from the residence. There are no interior pipes, all are carried outside and are properly trapped and ventilated; in fact, everything has been done to make them as perfect as possible." A conveyance of the property was executed on December 3rd, 1898. Shortly after this it was discovered that the drainage was out of order. The plaintiffs spent a large sum of money in thoroughly overhauling and reconstructing the drainage and now claimed a portion of the outlay as damages. It was also ascertained that in 1894-95 the only work done

to the drainage was represented by a sum of £63 spent upon it in order to render the house fit for the occupation of a twelve months' tenant. Counsel contended that the paragraphs of the particulars of sale above set out amounted to a warranty. Sir Edward Clarke, on behalf of the defendant, submitted that, assuming it was correct that there was a warranty, the plaintiffs had no case, for where an agreement for purchase and sale was followed by a conveyance the terms of the original agreement were merged in those of the conveyance and could not afterwards be relied on by either party except for the purpose of interpreting the language of the conveyance, unless there were grounds for rescinding the conveyance because of fraud or for altering it because of a mistake. Plaintiffs' counsel agreed that an action could not have been maintained after the conveyance for damage for any misrepresentation not amounting to fraud. But, he contended, where there was a warranty—as he was assuming for the present purpose there was—the case was different. The warranty was a collateral obligation which did not on the completion of the contract of sale become merged in the conveyance. Mr. Justice Wills said that the plaintiffs could not maintain the action. The nett result of the cases which had been cited was that where a contract was of a preliminary character and was intended to be superseded by a formal contract, and was in fact so superseded, then the superseding contract prevailed, and the stipulation of the preliminary contract could not be relied on. That was laid down in *Leggott* v. *Barret* (15 Ch. D. 306). The plaintiffs could not, therefore, after the conveyance, sue upon the terms of a warranty in the particulars of sale under which the subject-matter of the conveyance was originally sold. If it had been the intention of the parties that the warranty should survive there was no reason why it should not have found its way into the conveyance. Judgment was accordingly entered for the defendant.

New Companies.

Muirhead & Sons, Limited.

This company has been registered in Scotland with a capital of £50,000 in £10 shares to acquire and carry on the existing business of timber importers, merchants, and sawmillers.

THE BUILDERS' JOURNAL & ARCHITECTURAL RECORD

DECEMBER 19, 1900. No. CCCVI.

EFFINGHAM HOUSE, ARUNDEL STREET, STRAND, W.C.

An Architectural Causerie.

The Working Men's College. THE Working Men's College in Great Ormond Street, Queen Square, W.C., is an institution with which the names of many notable men are intimately connected. It was founded in 1854 by the late Frederic Denison Maurice (who is referred to in another paragraph), Charles Kingsley, John Ruskin and Thomas Hughes (the author of "Tom Brown's School Days"). At the outset the chief trouble was to find students, but now, as the result of the labours of the able men named—and of many others who have taken up the work they commenced—there are 800 students, a membership larger than ever before. It is felt that, notwithstanding the numerous evening classes and technical schools which have followed this first movement, the College has still an important part to play. With what regret therefore we have to announce that unless the sum of £4,000 is raised without delay the institution will be obliged to close its doors. Three years ago it was found that the buildings were in urgent need of repair, efforts were made to raise funds, and since that time half the money necessary to put the College in a sound condition has been subscribed; but the sum of £4,000 is still needed—for this is, approximately, the amount of Mr. Caröe's estimate. The object of the founders of the College was "to provide instruction for working men at the smallest possible cost in the subjects with which it most concerns English citizens to be acquainted"; and this object has been attained. William Morris was greatly interested in the institution, and Ruskin, Rossetti, Bowen and Burne-Jones were among its teachers. What a misfortune should the College be compelled to close on account of its inability to raise the comparatively small sum mentioned!

The Definition of "Construction." THE case of *Hoddinott* v. *Newton Chambers and Company, Limited* (which is reported in another column) is a striking example of the disagreement possible among the proverbial doctors. Last year the London General Omnibus Company took over some stables which had been built for them at Putney, but finding the building not quite so rigid as desired, they decided to stiffen it with some heavy iron stays, and it was whilst engaged in this work, with another workman, that Hoddinott was killed. The respondents were the contractors for the work. Judge Vernon Lushington first heard the case in the Wandsworth County Court; he dismissed the widow's claim for damages for negligence and assessed compensation under the Act of 1897. This Act stipulates that it only applies to employment "on, in, or about any building which exceeds 30ft. in height, and is either being constructed or repaired by means of a scaffolding or being demolished." The Court of Appeal reversed the decision of Judge Vernon Lushington, being of opinion that the building in which the accident happened was not being constructed or repaired, so that the respondents were not "undertakers." The House of Lords, whose judgment was given last week, have now reversed the decision of the Court of Appeal and rated them for limiting the application of the Workmen's Compensation Act. Lord Macnaghten put the case very clearly. As he pointed out, it is a strong thing to say (as Lord Justice Collins said) that when a building is once completed to the original design you cannot have anything further in the way of construction, unless the work practically means the erection of a new building. In Lord Macnaghten's opinion, "construction" cannot be limited to original construction; this would mean substituting "erection" for "construction." He preferred to rest his judgment on the broad ground that the three operations covering every varying phase in the life of a building were—construction, repair, and demolition: a decision which we think very satisfactory. The vexed question as to what constitues a scaffolding was also a feature in this case, and it will be seen by referring to the report how Lord Macnaghten emphasized that the words of the Act were not to be so narrowed down that the workman was debarred from receiving compensation.

The Old Jewellery Mart
King Street
St James Place
J Hutchings

A Much-needed Reform. REFORMS are generally the result of zealous reiteration and importunity—it could hardly be otherwise, for the introduction of new manners and methods is sure to meet with opposition from the few who benefit by the existing arrangements. Though tending to become wearisome, this reiteration is a necessity. Some of those who frequently went to hear the late Frederic Denison Morris thought that he harped too often on the one string, and tired of him, but it was this very tenacity which ultimately resulted in such remarkable success, which stirred men to prompt action in ameliorating the conditions of labour. We therefore make no apology for again referring to those huge letters which now disfigure every town in the country. These letters are on the increase, both in size and number, yet no action is taken to check the advertiser's ardour. It may be said without fear of contradiction that the letters in question are great eyesores in our streets, and that they give a restless and irritating appearance to the buildings used as supports for them. But the remedy is not far to seek. No one acquainted with the facts of the case would presume for a moment that individual shop-owners could be induced to voluntarily remove the letters, because if they did so surrounding rivals would benefit by their own letters being made more prominent by isolation. No, the change must be made by the municipal authority instituting a by-law which shall stipulate that no letters exceeding a certain size (say 2ft. high) shall be used. It is an old saying that the Englishman's house is his castle, but the particular point to notice in this instance is that the shop-owner would not lose anything by the change, while the public—or at least that portion of it possessing the least perception for harmony—would gain vastly. Comparisons are odious, but here they are useful, because if all letters were restricted to a certain size, the advertisers would be in the same position as before, the competition then raging between inches up to 2ft.—instead of to 10ft., as at present. There is no need to mention instances where these huge letters spoil the appearance of streets—they speak for themselves at almost every corner. The authorities should grasp the fact that their thoroughfares would be much enhanced by adopting the practical proposal made above. This would not be a panacea, but it would be a very salutary reform. Advertisers have been

checked in their schemes for sky-signs, the use of flash-lights and night signs has been made subject to certain restrictions (even for these we must be thankful), and the same supervision could be very beneficially exercised in regard to these street letters.

ANCIENT LONDON.

BY J. HUTCHINGS, A.R.I.B.A.

(*Concluded from page* 365, No. CCCV.)

NO article dealing, in however cursory a manner, with the London of the past can be considered complete without some mention of Stowe, the Capital's great archæological historian, to whom later writers owe so deep a debt. He was buried in the city he loved so well, and a monument still marks his resting-place in St. Andrew's Undershaft. This tomb is interesting more on account of the man himself than for any merit of its own. The design, with the exception of the pediment, is almost severe for the period, the carving being restricted to the faces of the pilasters which flank the effigy. On Stowe's account, St. Andrew's is the Mecca of archæologists, both in this country and on the other side of the Atlantic; and it is said that the quill pen with which the receptacle in the right hand of the figure is always equipped has occasionally been missed after a visit by some of our American cousins, as though it had been the very instrument with which the author penned his now famous records.

The same edifice contains a monument of more florid character to Sir Thomas Ofley and his wife, and others of more or less value. St. Andrew's, like St. Bartholomew's and St. Helen's the Great, is one of the few London churches which survived the Great Fire, and has been fortunate enough to escape the hand of the destroyer. Perhaps it owes its existence to the fact that the edifice was constructed of a durable stone, late in the Gothic period, and the site has not been required for any desirable street improvement. A lofty maypole used to stand close to the sacred edifice (hence the surname "Undershaft"), and great mayings and May games used to take place round its base. St. Andrew's Undershaft, in relation to these picturesque ceremonies, has been finely termed "that altar, for the worship of the old Springtime in London, and where rest the honoured ashes of him whose heart was as open to all the freshness and loveliness of the present as his mind was earnest and sagacious in inquiring into the past" (a church we could as ill have spared for Stowe's sake as for its own).

London abounds in retired nooks and corners where a rural peace prevails under the welcome shade of green trees, and where the ceaseless roar of the traffic is but a soothing murmur in the ears, and no longer the reflex of a passionate striving for mastery in the great battle of existence. In these retreats the poet may wander singing the praises of worthies whose monuments are all, or almost all, that are left to them, the archæologist may dream of the London of Stowe, and the artist may here find a quiet corner in which to indulge his art. St. Helen's Place is just such a spot as one of these, situate, too, where the stir and bustle of life is most concentrated. At present little beyond the old church remains of that ancient world with which we are at present concerned. Judd's Almshouses, once the property of the Skinners' Company, a formal brick structure dated 1729, occupied a site far too valuable for the maintenance of the original charity; consequently a few years ago the property came into the market, and was sold for a large sum of money. This institution for the benefit of six poor men was founded by Sir Andrew Judd, Knight, who was Lord Mayor in 1550, and a somewhat noteworthy character. Born at Tonbridge, and apprenticed at an early age to the Skinners' Company, he rose to a position of wealth and influence by the exercise of virtues of the Dick Whittington type, and four times filled the office of Master of his Company, in addition to enjoying the highest civic dignity it was possible for him to attain. Sir Andrew Judd was a patron of the new learning, and in this capacity conferred a lasting boon upon the town of his birth and the scene of his humble beginnings by founding the free grammar school.

During the rebellion of Sir Thomas Wyatt, Sir Andrew rendered valuable assistance to the cause of the Queen, his influence in the City being considerable. His bones repose in the church of Great St. Helen's, where his monument still exists.

On the side of the square facing the front of the church there used to stand some old brick buildings bearing the date 1646, and distinguished by the numbers eight and nine. They were excellent specimens of the rubbed brickwork of the seventeenth century, and though exception might justly be taken to the brick pilasters, in that age, when these features were considered indispensable, they were more pardonable. The top storey is unquestionably a later addition.

Previous to the Great Fire (1666), although the dwellings of the wealthy and the establishments of the church were constructed of stone, wood framing with plaster or brick filling satisfied the demands of the majority of householders. After that terrible visitation the Government issued a lengthy proclamation dilating upon the causes of the fire, which it attributed to Heaven, aided and abetted by the prevailing practice of building with combustible materials. It continued as follows: "And we do therefore declare our express will and pleasure that no man whatsoever shall presume to erect any house or building, great or small, but of brick or stone; and if any man shall do the contrary the next magistrate shall forthwith cause it to be pulled down, and such further course shall be taken for his punishment as he deserves; and we suppose that the notable benefit many men have rendered from those cellars, which have been well and strongly arched, will persuade most men who build good houses to practise that good husbandry by arching all convenient places."

In 1667 the Common Council passed an Act, requiring, among other things, "that the breast-summers of all the houses do range of an equal height, house with house, so far as shall be convenient, and then to make breaks by directions. And they do encourage and give directions to all builders for ornament's sake, that the ornaments and projections of the front buildings be of rubbed bricks, and that all the naked parts of the walls may be done of rough bricks, neatly wrought or all rubbed, at the direction of the builder, or that the builders may otherwise enrich their fronts as they please." Those regulations were duly sanctioned by Parliament, and in the course of time converted the picturesque metropolis of old into the brick London of the beginning of the century.

The designs of the doorways shown in the illustration of 8 and 9 St. Helen's Place are by some authorities attributed to Inigo Jones, the architect of the side portal of the church of Great St. Helen's.

The Jews' quarter in London, though infected by the modernising spirit of the times, retains a considerable amount of old property, much of

Judd's Almshouses
Great St Helen's
J. Hutchings.

it in a highly dilapidated and tottering condition. The Old Jewellery Mart is a typical example of the class that remains in the vicinity of St. James's Square, E.C., and is presumably of considerable age. The walls are warped, bulged, and out of the perpendicular, through general decay and the shrinking of the timber, unmistakable signs of the near approach of the inevitable end.

A jewellery mart was held here in the principal room on the ground floor, and a tablet over the chimney-piece bears the following inscription: "The original Plate and Jewellery Mart, established 1800, enrolled 1834." In the same apartment, in a little recess in the wall, is a board containing a list of the members of the St. James's Philanthropic Society for aiding the funds of the City of London Chest Hospital, Victoria Park.

Bermondsey remains quite a happy hunting-ground for the sketcher, with its numerous old galleried hostelries and top-heavy timber houses. It still retains its mediæval reputation for tanners and woolstaplers, but has since added numerous other industries to the category. The old warehouses in Bermondsey Street, of which an illustration is given, are most interesting examples of patchwork construction, and it is singular to compare the plastered walls and pantiled roofs with the severe, not to say bald, structures of our own day, erected to meet the exigencies of modern trade at the limit of cost compatible with strength.

One cannot without a feeling of real regret part with so many venerable and picturesque objects, the loss of which must leave the architecture of our streets the poorer.

DR. ADENEY ON THE PURIFICATION OF SEWAGE.

DR. ADENEY recently delivered an interesting address on the purification of sewage before the Architectural Association of Ireland. He stated that after several years of doubt and uncertainty, the purification of sewage had become generally recognised as a matter for its own micro-organisms to effect, and what the chemists and engineers had to do was to make provision for the conditions which had been discovered to be necessary to keep the micro-organisms of sewage healthily and busily engaged in exercising their true functions—that is, the oxidation of the polluting matters with which they were associated—and to prevent them from becoming, what they certainly would be if subjected to conditions unsuitable to their own healthy life processes—a danger to health. The necessary favourable conditions, and the amount of work which these micro-organisms were able to peform in the way of purifying large volumes of sewage had to a great extent been worked out by the efforts of a large army of investigators in this country, in America, and on the Continent, and it was gratifying to be able to state that Irish workers had borne an honourable part in advancing our knowledge of this great subject.

The Supply of Oxygen.

One condition was absolutely essential for these organisms, and that was an ample and constant supply of oxygen. The actual amount of oxygen required for the purification of a given volume of average town sewage, after the solid matters in suspension had been removed from it, could now be determined with great accuracy by a method suggested and worked out in this country. It had been shown by investigations carried out in the laboratory during the years 1890–95 that an average town sewage, after the solids in suspension had been separated from it, required one and a half times its volume of air to supply the volume of oxygen required by the micro-organisms of the sewage to effect the complete purification of the same. These figures have since been completely confirmed by experiments carried out on a large scale. It was not so difficult to supply large volumes of town sewage with the air required for their purification as might have been expected. The real difficulty had been, and still was, that of expense. One of the easiest ways of supplying the necessary oxygen to sewage was by diluting it with good river or sea water. Forty volumes of either contained an ample store of dissolved atmospheric oxygen to supply the organisms for the oxidation of the polluting matters in one volume of standard town sewage after the solid matters in it had been removed. Hence, when a populous city like that of Dublin is fortunately situated on a tidal river, with a strong ebb current to the open sea, its sewage is easily and satisfactorily disposed of, by first separating the solid matters it contains and then discharging the liquid portions on the ebb tide only, and as near to the mouth as possible. This statement would, no doubt, surprise many in Dublin, accustomed as they were to the foul state of the river Liffey, but this was because the sewage had been from time immemorial discharged into it in ignorance of all principles. If the solids were first separated and the liquid portions discharged only on the ebb tide, and near to the mouth of the estuary, it would do no more harm than had the Rathmines and Pembroke sewage, which had now been discharged into the estuary for the last twenty years. When towns are less fortunately situated the problem of the purification of their sewage became much more complicated. In addition to having to furnish the large volumes of air a large army of organisms had to be cultivated and concentrated in a small area. Both these conditions were most efficiently satisfied by

Filtration

through suitable porous land or through artificial filter beds. After the filter had been in use for a short time, organisms commenced to grow upon the surfaces of the material forming the filter; they then multiplied with enormous rapidity, and soon covered them with semi-transparent masses of organisms which oxidized, with astonishing rapidity, the organic matter in the sewage, as it passed over them in thin film-like streams, the oxygen being supplied from the air in the interstices of the filter. After a time this supply of oxygen became exhausted, and the passage of the sewage through the filter was stopped to allow the air in the interstices to be renewed. The filter might then be employed again, and so on for a long time. Besides being the most efficient means of purification, filtration was the quickest, effecting the purification in the course of a few hours. The size of the filter beds required for the purification of the liquid sewage of a given town could be easily calculated, when the volume of air required for its oxidation had been ascertained by the method above referred to, since the organisms always required like volumes of air for the purification of like volumes of similar sewage, and since the total volume of air in a filter might be taken as equal to one-third its own volume. It had been calculated from laboratory experiments that three acres of filtering bed 3ft. thick could purify 1,000,000 gallons of liquid sewage, supposing the filter to be filled three times every 24 hours. These calculations had recently been confirmed by Mr. Mansergh, President of the Institution of Civil Engineers, London, in a report to the Sheffield Corporation. The one great objection to filtration was that of cost. It was to get over this difficulty that Mr. Kaye Parry and the speaker had suggested the addition of small quantities of nitre, which could furnish

oxygen in a condensed form to the organisms as a substitute for filtration.

There was a second important question in the sewage problem, that was the separation and disposal of the solids of sewage, and this had proved in the past quite as difficult as that of the liquid portions of the sewage; but with our present knowledge of the chemical and biological principles underlying this part of the problem there was no doubt that all difficulty in its practical solution would soon be overcome. By means of the septic tank it seemed possible to satisfactorily dispose of about 50 per cent. of the solids. The septic tank was simply an open cesspit, on the surface of which the solids were allowed to accumulate until they formed thick crusts completely covering the surface, and gradually rising above it for several inches. In this condition the solids became drained and freely exposed to the air, and were then rapidly oxidized by their own organisms. But the septic tank only disposed of 50 per cent. of the solids. Mr. Kaye Parry and the speaker had, however, shown that the solids could be satisfactorily disposed of in accordance with bacterio-chemical principles, by precipitating them by means of certain compounds of manganese. The solids were then separated, and at the same time were mixed with certain oxides of manganese, which contained oxygen in a combined or, as we may term it, in a condensed form that could be utilised by the organisms. When the separated solids and oxides of manganese were stored in heaps the solids did not become offensive, but underwent slow oxidation until they were completely oxidised and could be safely used as valuable manure. Dr. Adeney said, in conclusion, that he trusted that he had said enough to show that the disposal and purification of sewage on a large scale was from beginning to end a work for its own micro-organisms to perform, and that the conditions most favourable for keeping them healthily and constantly employed, doing the maximum amount of work they could do, were all factors in the great problem of sewage purification, which were gradually becoming more and more clearly visible and attainable as the reports of each new effort to bring the organisms into operation on a large scale were published.

TWO GERMAN TOWNS.

WORMS AND FRANKFORT.

[The following particulars are given in connection with the two drawings of Worms Cathedral and Luther's House, which are published with this week's issue.]

WORMS became the capital of the kingdom of the Burgundians as early as the year 431. This old town was the residence of the Franconian kings and afterwards of Charlemagne and his successors. It was here, too, that Luther, the great reformer of Germany, defended his doctrines before the Emperor Charles V. Worms suffered terribly during the Thirty Years' War, and was repeatedly occupied by Mansfield and Tilly. In 1689 Count Mélac and the young Duc de Créqui pillaged and burned down the town, leaving only the cathedral and synagogue standing. Until 1801 the town retained its independence, and after the short-lived French supremacy was annexed to Hessen-Darmstadt in 1815. The town is now somewhat dismal; the streets are dull and the residents seem inactive. Situated in a most prominent part of the town, and standing upon the position of the old ramparts, is Luther's monument. This imposing memorial, erected in 1868, was designed and partially modelled by Rietschel, being completed, after his death, by Kietz and Dondorf of Dresden. A massive stone platform bears in the centre a large pedestal surrounded by smaller ones upon which stand statues of Luther's great forerunners —Wickliffe (d. 1387), representing England; Waldus (d. 1197), the father of the Church in the mountain-valleys of France; Huss (d. 1415), representing Bohemia; and Savonarola (d. 1498), representing Italy. The central base supports a large bronze pedestal adorned with reliefs depicting scenes from Luther's life, and medallion portraits of those of his contemporaries who contributed to the Reformation, and upon this pedestal is Luther's bronze statue, 11ft. high. He stands with his face uplifted and is holding a Bible in his left hand, and upon this his right hand is also placed; thus he forms a commanding figure. Luther's friends and contemporaries Melanchthon and Reuchlin stand at the angles at the rear of the platform, and the brave princes who befriended the Reformer, Frederick the Wise of Saxony and Philip the Generous of Hessen, are placed on either side of the front, the former holding an upraised weapon and the latter leaning on his sword, each statue being 9ft. in height. In the centre of these on three sides of the square stand allegorical figures of the towns of Germany which first embraced the reformed faith. The total cost of the monument amounted to about £17,000, and the execution and erection extended over a period of nearly nine years.

The cathedral is a building of very ancient origin, but not a particle of the original structure is now in existence. The oldest part of the present building, the western towers, date from the beginning of the twelfth century. This very striking and effectively grouped cathedral, with its four circular towers at the angles, two domes and double choir, ranks, like those of Speyer and Mayence, amongst the best specimens of Romanesque architecture in Germany. The interior has been effectually restored and is adorned by many very interesting historical objects. The Baptistry on the left side of the south portal contains some large stone high-reliefs, representing the Annunciation, the Descent from the Cross, the Resurrection, the Nativity, and the Genealogy of Christ, beautifully executed and in very good preservation, dating from 1487 and 1488. They were presented by noble families of the town and then placed in the old cloisters of 1484, upon the demolition of which, in 1813, they were removed to their present position. The font was removed from the ancient Chapel of St. John, which was demolished in 1807. A well-executed tombstone of the Knight of Eberhard von Heppenheim (d. 1559) is also in very good preservation, the noble knight being represented in a kneeling position, and clad in a coat of armour.

Frankfort-on-the-Main dates from the time of Charlemagne, he having held there a convo-

cation of bishops and dignitaries of the Empire as early as the year 798, and after the erection of a palace by Louis the Pious in 822 the town increased extensively, and reached to such a high degree of prosperity that upon the death of Louis in 876 it was considered the capital of the East Franconian Empire. It is now, from a commercial and financial point of view, one of the most important cities of Germany. The city lies in a spacious plain, bounded by mountains, on the right bank of the navigable Main. Other than the Gothic cathedral, which was founded in 1238, Frankfort has but few real architectural attractions, although the air of wealth and importance which pervades affords an indication of the vast extent of its commercial relations. Goethe's house, like Shakespeare's at Stratford-on-Avon, is still carefully preserved, and has an inscription on the front, "Johann Wolfgang Goethe was born in this house 28th August, 1749." Within a little distance of the great poet's house, and opposite

the north-east corner of the cathedral, still stands an old slate-covered house, which was once the home of the great reformer, Luther, and from which he is said to have addressed the people when on his journey to Worms. The house is now marked by the effigy of Luther, with the inscription: "In quietness and in confidence shall be your strength." The fine monument of Gutenberg and his compeers, Fust and Schöffer, was erected in 1858. The three bronze figures stand together upon a massive stone pedestal, and on the frieze below are portrait heads of fourteen celebrated printers, including that of Caxton. In the lower part of the pedestal are the arms of Mayence, Frankfort, Venice, and Strasburg, in which four cities printing was first practised. At the angles of the main pedestal are seated upon lower ones figures representing Poetry, Theology, Natural Science, and Industrial Art, and immediately below these are four drinking fountains pointing to the four corners of the globe. The monument of Goethe, erected in 1844, with the allegorical reliefs on the front of the pedestal and the figures from the poet's poems at the sides, form an imposing group.

EXAMINATIONS FOR ARCHITECTS.*

BY W. COOPER.

THE training of an architect's pupil, if carried out in the orthodox style, is somewhat as follows, varying slightly according to circumstances:—

On entering the office he practises office routine, such as copying specifications, quantities, and builders' accounts, tracing or copying drawings made by the draughtsmen of the office, and in spare time copying examples of well-known works, measuring up old buildings, studying building construction (and sometimes geometry and perspective) reading the history of architecture, and endeavouring to learn dates relating to the same; occasionally he will attend art classes and science lectures in connection with the School of Science and Art if in the provinces, or if in London, he will attend King's College, the Architectural Association classes, or other technical classes, and various private preparation classes.

Thus, if the student wishes to excel in the examinations instituted all over the world for the advance of his art, he must work diligently upon the works of other men, both in buildings and in writings, leaving no time for improving himself in any original ideas that he may be possessed of. He is induced to enter a competition for a scholarship or for a building; and how well he knows that if he does not adopt the particular style in fashion, he stands no chance of success. For instance, what assessor will now look at Gothic work?

It is needless to say that such a process of education stamps out for all time any chance of the student working in an original way; because usually his time for working out original problems has passed when he commences working in earnest professionally; yet this is the course of study which must be adopted if a man wishes to pass an examination to qualify as a member of any society of architects of standing. It is essential that an architect should have an artistic mind; he should also be a constructor, he should be trained in business matters, he should have a very thorough practical knowledge of materials and their uses, and be up to date in sanitary matters.

* A paper read before the Society of Architects on December 13th, 1900.

Art and Style.

In design absolute freedom should be allowed to the candidates. Style should be ignored, and many marks awarded for good *proportion* and consistent originality; this would save some very precious time in preparation, and anxious and worrying months comparing differences of style, periods of architecture, and details of ornament relating to the same; it would also induce a freedom not yet attained by latter-day architects. Study of former examples is well in its way, but it should be confined to the archæologist. Why go back? If progress is required the motto must be "Forward."

Some will say, "Who is to judge the artistic merit of the design, or the good proportion of the features composing it?" The reply to this is, "Who shall judge the value of a picture?" or any other work of art, such as the grouping and finishing of a design in sculpture.

Very few marks should be given for neat draughtsmanship. It is a great tax upon some art men to make finished geometrical drawings, and this has the effect of cramping the hand and injuring the eye for drawing freely. A good knowledge of freehand drawing, shading, and perspective is imperative; sufficient value is not given to these subjects, although they are all important to the art-architect.

Construction.

Unfortunately the gift of art and science is not usually very fully developed in one brain: consequently our most artistic men are bad constructors, and good constructors are invariably bad designers. Time can well be saved by requiring only a knowledge of the books in which to find formulæ for calculating strains and stresses, and other things (which are now required to be committed to memory), and how to work them out. The candidate

should therefore be allowed to have books of reference, such as architects have in their offices, but the questions should be such that the test of the study of the books is very thorough, so far as the means of finding out matter necessary to correct construction is concerned.

The anatomy of the building must be known, for as the sculptor and a painter is better qualified by knowledge of the anatomy of the subject he carves or paints, so an architect must be more proficient the more he knows of the general principles of construction. The examinations in this should be very searching. Usually there is too much theory and not enough practical knowledge required of the candidate. Foundations, and how to deal with any formations upon which a structure is to be built, should be one of the compulsory questions.

Materials.

In this paper the candidate should show a knowledge of the names and addresses of well-known experts and testers of all classes of building materials, how all kinds of building materials are employed, and the reason why they are used for particular purposes; he should also know the colour and distinguishing features of the various stones and woods. Some rough-and-ready practical tests of the materials, such as bricks, stone, cements, lime, timber, and artificial preparations should be required, but most important of all, a thorough acquaintance, by sight, of the actual materials, samples of which should be in the examination-room. To the artistic mind, committing matter to memory is usually tedious and aggravating to a degree, but to remember by sight is comparatively easy.

The Contract.—A copy of this should be placed before the candidate and it should be required of him to explain any portions of it. What is the use of committing it to memory, as is required by most examining bodies?

Prices.—A schedule of prices should be given, upon which to base the estimate of works or of the contractor's bill of extras. Values vary so frequently, and rise and fall so rapidly, they also vary in different centres so much, that it is impossible to have a thorough knowledge of them at any time.

Quantities.—A certain knowledge of quantities is necessary, both in the method of taking them off, abstracting, and billing, but few marks should be given for this, because an architect is not necessarily a quantity surveyor, but it is required of an architect to be able to check measurements and to measure his own work.

Land Surveying and Levelling.—This is wanted in a limited degree, and no examination is complete without questions upon it, because every architect who has to live by his profession, with a small practice, has problems in land measuring, and it is necessary to his success that he should know how to do it, at any rate until he can afford to keep or employ a land surveyor to set out the plan and levels of the land he proposes to develop.

Specifications.—A thorough knowledge of specifications is essential, and the candidate should be required to write a specification governing every part of his design, with the assistance of a skeleton specification to work upon.

Sanitary.—The general laws laid down by sanitary experts should be known by memory, both for a building in the country and in a town; he should know how to test drains and to check the deception practised by contractors. For weights of pipe, etc., books of reference might be allowed.

Decoration.—Without the qualification to blend colour, many an otherwise good building would be ruined. Decoration should therefore have strict attention and rigid examination.

Time for the Examination.—Two weeks, at least, is necessary to do justice to the subject. Some are much slower in their work than others; ample time should therefore be given, so that the slow and thorough should have the same opportunity as the quick.

I have endeavoured to show by this paper that I would expunge from the examinations all unnecessary questions, such as: "Where does olive oil come from?"; "Who was Xenophon?"; geography, languages (except English), mathematics (beyond that portion required in an architect's practice), dilapidations, chemistry of materials, history, and all other subjects unnecessary to the uplifting of architecture in the true sense of the word.

We are living in an age of construction unlike any that the world has ever before experienced. I mean steel construction; yet there has not been a successful attempt to apply it architecturally. Why is it so? Because architects of the present generation are trained to slavishly copy and study the works of architects in stone and wood. Under the present system of tests, the man who has the best memory holds the best position in the examination. It should be the man who answers the most practical questions best who should be given the first place.

THE BUILDING TRADES' GIFT.

MT. T. F. RIDER, past-president National Association of Master Builders, as honorary secretary to the Building Trades' Gift to the Nation, announces the following further contributions which have again come to hand:—

	£	s.	d.
West Bromwich Master Builders' Association (per Mr. Henry Smith)	19	14	3
Stockport Master Builders' Association (per Mr. R. Williamson)	12	9	0
Workmen of Messrs. G. Longden and Son (per Secretary of the Sheffield Master Builders' Association)	8	10	3
Workmen of Mr. J. M. Boekbinder, Camden Town	5	0	0
Messrs. John V. Kiddle and Son and Workmen	4	4	0
Mr. C. F. Kearley and Workmen (Kensington)	4	0	0
Mr. C. M. Schmidt and Workmen (Upper Holloway)	3	3	0
Messrs. Davis and Leaney and Workmen (South-end-on-Sea)	3	0	6
Workmen of Mr. F. Cottrell (Crouch End)	2	12	0
Workmen of Messrs. Battley, Sons, and Holness (further contribution)	1	3	6
Mr. F. Cottrell (Crouch End)	1	1	0
Mr. Chas. Rotson and Workmen (Lewisham)	0	16	6
Mr. G. A. Williams and Employees	0	9	0
F. M. (per Editor of THE BUILDERS' JOURNAL)	0	2	0

The Excavations at Silchester.—The work of excavating the Roman remains at Silchester (Calleva) has been brought to a close for the year. Among other interesting relics discovered during the past season's operations are tesselated floors, a special piece of mosaic pavement with a figure representing a dolphin, and upwards of one hundred pots of different size and shape. Some blacksmith's tools, a padlock, coulters, a bronze figure, and other articles have also been dug up. The excavations will be resumed in the spring.

Bricks and Mortar.

APHORISM FOR THE WEEK.

The sculptures wind aloft
And lead, through various toils, up the rough steep
The hero to the skies.

(Trojan's Column).

Our Plates. SOME particulars about Worms and Frankfort will be found on page 384 of the current issue. Haughton Hall is about five miles from Stafford, on the main road to Newport, Salop. It is situated about 20ft. back from the road. New floors have lately been laid, and the interior painted throughout. The brickwork is all lime-washed, with the exception of the dairy and the chimneys. The oak studs average 6½in. wide, and are 8in. apart. They are coated with tar, and the panels between are of trowelled smooth stucco, which gives the whole a very pleasing appearance. The hall is in the occupation of Mr. J. Baker, who allowed Mr. Henry W. Simister to measure it. The church of St. Mary Magdalene, Taunton, ranks among the finest of the Somerset churches, and is of especial interest because of the beautiful tower, which has been described as one of the finest specimens of Gothic church architecture in the West. In the interior, one cannot fail to be impressed by the height of the nave, and the panelled arch of the tower, which give great grandeur to the body of the church. There are six clerestory windows on either side, each having four lights. Between the windows are elaborately-carved niches, originally intended for the reception of statues. In fact, statues (probably of the Twelve Apostles) occupied these niches, but during the fanaticism of the Reformation they were wantonly destroyed. On one of the nave piers on the north side is a very finely-carved niche, in which stands a statue of the Virgin Mary. The roof is of oak, and is a good example of mediæval timberwork. It was in a bad state of repair a few years ago, and has, comparatively recently, been thoroughly restored. Our illustration is from a drawing by Mr. W. Lee Clarke.

Cardiff's New Museum. A SERIES of sketch plans of the proposed new museum and art gallery in Cathays Park, Cardiff, by Mr. Ward, the curator, was submitted at a recent meeting of the Museum and Art Gallery Committee as a basis of the general scheme, and these plans were adopted. The new buildings are designed on the so-called gridiron type, of which the British Museum is a notable example. The honorary curators consider that the first portions of the building, if they are to meet the probable needs of Cardiff for ten years, will certainly exceed the limit of the funds estimated as available from the museum rate for building purposes, namely £12,000. The committee were anxious that a sum of at least £20,000, in addition to the £6,000 contributed by the executors of the late Mr. J. Pyke Thompson, should be placed at the disposal of the building committee.

London Housing Problem. ONE of the largest of the blocks of working-class dwellings now being erected on the Millbank estate, Westminster, will shortly be completed. The block is about 320ft. in length, is divided into four houses, and contains 85 tenements and 215 rooms, providing accommodation for 430 persons. It is proposed to acquire a site consisting of about one and a quarter acres abutting on Wedmore Street, Holloway Road, Islington, for £11,650, to be increased to £12,000 if the Council are able to obtain possession from the lessees on the completion of the purchase. The land will be used for the erection of working-class dwellings. The site originally recommended to the attention of the Housing of the Working Classes Committee consists of two portions; (1) a site in Wedmore Street, with a frontage of about 240ft. and a depth of 200ft., containing an area of about 52,600 sq. ft., occupied by a row of eight small semi-detached houses, with a large area of land in the rear; and (2) a site fronting Holloway Road, containing an area of about 11,000 sq. ft., and occupied by four houses. Having regard to the fact that the possession of Holloway Road site could not be obtained for two or three years, and that its price would be much higher than that of the Wedmore Street portion, the Committee did not consider it desirable to proceed further with this portion of the site. With reference to the Wedmore Street land, plans and estimates have been prepared, showing that block-dwellings affording accommodation for 1,050 persons in five one-room tenements, 140 two-room tenements, and 80 three-room tenements, all self-contained, could be erected without a charge on the county rate.

The Hayles Buildings. THE Hayles Trustees in Lambeth have erected six blocks of workmen's dwellings in the vicinity of the Elephant and Castle since 1887. The most recently-erected structure, opened on December 5th, has cost £11,163. It contains 126 rooms, and provides twenty-four suites of four-roomed and ten suites of three-roomed tenements in St. George's Road and Hayles Street. The average rental is about 2s. 6d. per week for the three-roomed dwellings, and 2s. 9d. for those containing four rooms. Each flat has a separate entrance, and is provided with all the conveniences of a complete dwelling. There is an ample supply of cupboards and drawers; there is to each a little scullery, with boiler, and outside the living rooms is provided a safe for food. The total accommodation now provided under the scheme is sufficient to house 1,000 persons. A nett income of about £2,700 is derived from the rentals. The land, if let on building lease, would only produce about £400. The architects are Messrs. Waring and Nicholson. The scheme devised by the trustees is acknowledged to be one of the most successful yet attempted, but no scheme yet devised provides for the poor labourers earning from 15s. to £1 per week. The Hayles dwellings are occupied chiefly by artisans, but the labourers in the district are still obliged to herd together in single-room tenements. The Board of Trade inspector has expressed the opinion that the buildings on the Hayles estate are the best of their kind in the metropolis.

National Eisteddfod, 1901: The Pavilion Architect. A MEETING of the pavilion committee of the National Eisteddfod of 1901 was held at Merthyr recently, when Mr. Thomas Roderick, of Aberdare, who has accepted the position of architect, was present. This gentleman has undertaken that in the event of the Eisteddfod being a loss, he will make no charge for his services, stipulating only for a small fee in case there should be a surplus It was explained by Mr. Roderick that the pavilion at Aberdare, the plans for which he prepared, cost £1,150, and that it contained accommodation for 12,000 or 13,000 persons. A committee was appointed to go with Mr. Roderick over the ground in Penydarren Park, where the pavilion is to be erected, in order to fix upon the exact site for the structure, the architect being authorised to prepare a rough design of the building for submission to the committee at another meeting.

Jerry-built Cottages. SAYS the "Globe": "In itself, the movement to transfer congested urban populations to suburban districts provided with adequate travelling facilities has much to commend it. Purer air, more elbow-room, and greater comfort are obtained, while the expense of travelling to and from work should be balanced by lower rent and cheaper living. There are some drawbacks, it is true, particularly the greater sacrifice of leisure time on the daily journeys, but against that loss the gain to health is a fair set-off. At York, however—possibly in other towns—discovery has just been made that better sanitation is not always secured by migration. A member of the City Council, after making personal investigation both inside and outside the urban boundaries, affirmed that the large majority of fever cases occur, not as was supposed in the town slums, but in new cottages in the outside fringe of dwellings. Most of these habitations have been brought into existence by speculative builders, and low rentals being imperative to obtain quick tenancy, the outlay on drainage had to be stinted, to provide a margin for profit to the owner. There is only one remedy for this insidious undermining of public health; before any house intended for human occupation is brought into use, the whole of the drainage and other sanitary arrangements should be certified as thoroughly efficient by competent authority. Too often official inspection is carried out in merely a perfunctory manner, with the result that imperfections are not discovered until the outbreak of some epidemic."

The Tiber Embankment. THE collapse of the embankment of the Lungo Tevere Anguillara, the sinking of the earth on the Lungo Tevere Alberteschi, and the cracks in the pavement of the Lungo Tevere dei Mellini have raised afresh the whole problem of providing for Rome a sure means of defence against the sudden floods to which the Tiber is liable. Last week the Pantheon was under water to a depth of 8ft., and the Forum was flooded. Violent accusations are being brought against the contractors and the engineers who constructed the existing embankment. Two engineers who have studied the hydrographical question of Rome have come to the reasonable conclusion that the embankment was pushed into the river by the pressure of a large mass of rain and spring water accumulated in the subsoil near the embankment. As long as the Tiber was in flood the pressure of the water against the face of the embankment counterbalanced the pressure of the water accumulated, under the soil behind the embankment; but, as soon as the river fell, the masonry and the brickwork gave way under the weight of the water and toppled over into the stream. The reason why this has never happened before is that the rainfall during November, which in ordinary winters averages about 10 centimetres, amounted this year to 34·3 centimetres. Consequently, the pressure of the pent-up water on the back of the embankment was tripled, and the structure proved too weak to stand the strain. This explanation, which everything appears to confirm, diminishes the responsibility of the contractors, who were accused of having done bad work, but increases that of the engineers, who seem to have neglected precautions against so natural a phenomenon.

Royal Academy Students' Prizes. SIR E. J. POYNTER, P.R.A., distributed at Burlington House last week the prizes won by students at the Academy Schools in the recent competitions. The President said, in opening the proceedings, that it was the opinion of the members of the Academy that the present was one of the best competitions that had been held. In antique drawings there was a very great improvement on the drawings exhibited for some years past. The drawings from the life and the painting of heads from the life were also above the average. The works of the modelling school were remarkable, and he noticed especially the excellent study of a draped figure; he did not think better work would be found in any school in Europe. The designs for the decoration of a building were of a very good average, rather higher than usual. The following were prize winners on subjects relating to architecture:—Design for the decoration of a portion of a public building (subject, a procession of the Hours), prize £40, Miss Florence Eleanor Chaplin; design in architecture (subject, a portion of a street front), travelling studentship £60, Mr. Henry Tanner; set of architectural drawings (subject, the Church of St. Mary Woolnoth), 1st silver medal, Mr. Alfred Charles Bossom; set of architectural designs (Upper School), prize £25, Mr. Bernard Hugh Webb; set of drawings of an architectural design (Lower School), prize £10 Mr. James Black Fulton; plan of a building (subject, a bank), prize £10, Mr. James Hervey Rutherford; perspective drawing in outline, open to architects only (subject, the three central bays of the front of Whitehall), silver medal, Mr. George Thow Smith.

R. I. B. A.

TENDENCIES OF THE MODERN SCHOOL OF ARCHITECTURE.

BY PROFESSOR BERESFORD PITE.

A MEETING of the Royal Institute of British Architects was held at the rooms in Conduit Street, W., on Monday evening, when the president (Mr. William Emerson) occupied the chair. Mr. Alexander Graham announced with regret the deaths of Mr. John Butler (Fellow) and Mr. J. Buckley Wilson (Fellow). Professor Beresford Pite (Mr. Pite has recently been appointed Professor of Architecture at the Royal College of Art, South Kensington) then read his paper on "Some Tendencies of the Modern School of Architecture."

In his opening remarks Professor Pite said that a generation had arisen untrained in the orders and systems of proportion of the art of architecture. The published curricula of the centres of architectural education offered no evidence of the pursuit of the Classic methods of dimension, proportion and conformity to type upon which the school of the early part of the nineteenth century based its ideals of architectural beauty. The old Classic school was dead. But it died a school, and left existing its concrete methods, its parts, proportions, principles and orders accurately systematised and available for the use of all enquirers. Its great and chief antagonist had also fallen, for but little life remained in the Gothic school that once dreamed of universal sway. But, asked the lecturer, is the Gothic Revival dying with the dignity, traditions and possibilities of renascence of the older school which it displaced? Reviewing the course of the Gothic movement, the lecturer glanced at the training and methods of the school, its standards of taste and criticism, its earnestness and enthusiasms, and the spirit in which its students sought to solve the architectural problems of their day. The student was instructed by constant and repeated observation and study to drink in the spirit of the old work, and to design his new buildings while under its exhilarating influence. The mediæval spirit as it was, as it worked, as it drew, was all of system, principle, or method that the modern architect could need; but when the change came and the lamp went out there was no residuum of framework, method, or principle, only the inchoate notion of the wild but real beauty of all old work, and a new delight in picturesque draughtsmanship. These were the two main resultants of the Gothic Revival at the time of its effective decease, and these effects have since formed the staple principles of most pursuers of the art of architecture in England.

The progress of the doctrine that all old work is beautiful has been steady, and a limit has scarcely yet been formed for juvenility of the subject of beauty. Yet it must be presumed that the quaint conceits of partial ignorance, with added charms of romantic history, ruin, decay, lichen and ivy growth, have entered unconsciously into the current estimate of the beauty of old work. Apart from these accidents, there is little that can be described as good or even tolerable design in much old work that has been considered admirable because it is charming. We have lost our way amid the beauties of English antiquity. We pursue no definite idea now, but wander aimlessly among the enchantments of quaintness, originality and unrestrained, though demoralising, freedom of design; but the lecturer expressed his conviction that under the seeming voicelessness of the new sound now in our midst there is an intelligence and a purpose of expression sincere, earnest and useful. The hardly developed tongue is one of protest against thoughtless repetition and meaningless quotation in a dead language, and a resolute endeavour underlies it to speak for itself on behalf of liberty to be free from convention in its architecture, and for its attempt to oust the affectation of style by an unaffected stylelessness of difficult simplicity. Ornament in the ordinary acceptation is an abomination to it, while architectural features, methods and terms must be scorned out of their arrogance, put away, and forsaken. An enquiry whether we shall in the course of elimination and abnegation attain to the simplicity of Stonehenge or of the Great Pyramid in our everyday architecture may indicate the danger, if not the absurdity, of striving to make a complex civilisation, as reflected in a necessary art of civilisation, unnaturally simple.

The lecturer went on to show that almost the same point had been reached by another road, namely, through the genius, the efforts, and achievements of such leaders of the Gothic school as William Burges, Edward W. Godwin, William Morris, and J. D. Sedding.

In the modern school we have the fruit of seed sown by the great architects of the Gothic movement, namely, the revival of the building and decorative crafts. The starting point of the early leaders was romance, taste and association. Pugin discovered the riches of ecclesiastical decorative art, and in vestments, furniture and altar fittings opened up a new world of form springing from natural and refined craftsmanship. With the advent of William Burges a truer insight and completer grasp of the range of mediæval art was obtained. With scholarly completeness and patience he worked away from the modern architect's standpoint down, or up, to the craftsman's level. His was a living art; any example of his works, whether in building, goldsmith's work, decoration, or furniture, would be attractive and beautiful to us now. Edward W. Godwin had a very similar genius. He took full advantage of the liberty the "Queen Anne" movement offered of release from the traditions of so-called style, and felt his way and worked as a building designer of simple villa houses and economical artists' studios with a rare and refined originality. Present day æstheticism has not carried us beyond the point he attained in his houses at Turnham Green and studios in Tite Street, Chelsea, now twenty years old.

William Morris, himself a fruit of the Gothic movement, and in the sum-total of his life-work mediæval in the truest sense to the end, represents the link between the revival in architecture and the pre-Raphaelite movement in painting. His influence and power are working at the present moment upon most, if not all, of the decorative arts. His practical alliance of artists and craftsmen, especially in early days, was an experiment which has left a permanent success as its result. Principles, however, which seemed obvious in Morris's hands when dealing with decorative art have proved difficult to carry to any extent into the practice of architectural building. Artistic enthusiasm by the craftsmen of brickwork and of masonry is, under present conditions of civil life and business, almost impossible. The attainment of a commonplace standard of honest, sound work is all the architect can hope for, and there are not as yet symptoms of any development among the craftsmen themselves of an enthusiasm for the artistic possibilities of their work which can be allied with the similar movement in the decorative arts stimulated by William Morris. Still, these difficulties have not hindered the achievement of much interesting experimental work.

Referring to the late J. D. Sedding, the lecturer said that his manifold gifts peculiarly qualified him for carrying an arts and crafts crusade into the midst of the architectural world. Practical contact with the crafts closely allied to his ecclesiastical work as an architect doubtless drew him to feel the force of Morris's teaching, and he unhesitatingly bounded towards the brilliant vision, that seems almost impossible of attainment to us, of a living revival of the building crafts as a basis for all architectural design. Holy Trinity Church, Sloane Street, is the best illustration of his methods. The crafts are contained and displayed within the architectural enclosure of the building, and in the screen wall, pulpit rails, gates, table, and other fittings assert their presence and independence vigorously.

Of the actual effect in a monumental or public building of the new teaching we have as yet no serious examples. But in a smaller class of buildings, in some interesting domestic instances, we find the enthusiastic architect more or less successfully breasting the tide and importing by the sheer force of his own character the interest of some one or other of the building crafts into his work.

The lecturer went on to give his conception of the architect's relation to the building art, *i.e.*, as the designer and master-craftsman. He trusted this was not the empty vision of an unpractical ideal, without examples or instances of achievement. There is, for those who would seek it, abundant encouragement in unlooked places; efforts, sometimes crowned with conspicuous beauty, have been made by earnest men, profoundly dissatisfied with the prevailing want of true ideal, building upon the basis of building art with simple and beautiful form, devoid of the shibboleths of style, and in many cases rising with them through the level of past art to new life and true modernity of beauty. Of architects whose work may be considered to have attained this quality, the author mentioned the late William Butterfield, Mr. Philip Webb, Mr. Norman Shaw, and Mr. Bodley, passing their works in review, and noting the distinctive merits and characteristics of each. The genius will growingly be appreciated by which Butterfield discerned and seized the essential motive of mediæval building art, and forthwith strove to think for himself and express his own thought in his material for its modern purpose, with absolute new art. In the field of domestic building Mr. Philip Webb occupies a somewhat similar position; the same aloofness from the current standards of architectural "style" characterises his work as Mr. Butterfield's. His houses in Lincoln's Inn Fields and Kensington Palace Gardens are excellent examples of his art. Mr. Norman Shaw's creations are too present to be correctly estimated. His grasp of the superficial beauty of old work has been combined with an equal internal completeness, and an amazing versatility qualifies him in later English Classic as in the earlier barbaric, crooked Gothic. He seems to know and feel for each phase alike. Why and how does this genius charm? Is it the man rather than the work? The artist-architect or the architect-builder? The building that provokes the one question is promptly answered by another of the opposite tendency, and yet all are of one spirit. Is this spirit modern, or does it rise with the charms of the spirit of a departed beauty upon our dreams; or is it a living nineteenth-century actuality, typical of our attainment in life and art? Mr. Norman Shaw's school leaves us in little doubt; its members are among the most earnest and successful exponents of the craftsmanship doctrine. In ecclesiastical art of the Modern School, Mr. Bodley, with his complete and perfect sympathy for the crafts of religious art, has been enabled to maintain a useful and effective guidance. In his work, and in that of his immediate followers, there is a sense of satisfaction with the restrained and refined development of later Gothic and Perpendicular for which he has such feeling. The charm is that of perfected fifteenth-century art, revived with the completeness of the original, and infused with its motive and spirit.

Referring, in conclusion, to our civil architecture, the lecturer said that the system of competitions had produced a habit of reckless originality, of tawdry picturesqueness, of ill-digested unscholarly design which was having an alarming influence. Here the lack of tradition and of a school of settled orders and proportions has the most damaging effect. In domestic and ecclesiastical art we have survived the Gothic Revival and its repression of classicism with some success, but in civil architecture our architects are sadly and truly demonstrating their demoralisation.

A discussion followed in which Mr. J. M. Brydon, Mr. H. H. Statham, Mr. H. G. Ibberson, Colonel Lenox Prendergast, Mr. E. T. Hall, Mr. E. W. Hudson, Mr. G. H. Fellowes Prynne and Mr. William Emerson took part. From the title of Mr. Pite's paper, said Mr. Brydon, one gathered that there was a modern school of architecture—this was something to be thankful for; and one assumed that there was a tendency—and that was encouraging. In his opinion throwing overboard all the styles, simply

for the sake of doing so, was of little use; it was better to go back and study tradition. He looked forward to a characteristic modern school in the picking up of the broken thread of English architecture where it was dropped by the late Professor Cockerell. Mr. Statham could not see what Mr. Pite was driving at, and did not quite understand what was proposed to be the line adopted for a new movement. He felt that the charm of the work of such architects as Butterfield was that it was based on a careful study of the best efforts of the past with the originality of the designer grafted on, beautifying it. As to competition designs, in his opinion it was those possessing a good plan and a tolerably conventional elevation which stood the best chance, as these were considered safe—the eccentric designs did not succeed. Colonel Prendergast thought that under our present circumstances we needed to go back to the grammar of the whole thing. We could not deal with architecture as if it were millinery. But going back to the past was, in Mr. Hall's opinion, not the proper thing to do. We should do what the thirteenth-century builders did, that is, create for ourselves a style and not become the slaves of copyism. We are not gods to create with nothing, said Mr. Fellowes Prynne, and it were better for us to take the models of the masters, to study them, to assimilate their spirit, and then evolve from them a distinctive style of our own; while Mr. Emerson pointed out that the men whose works had been so admired were those who had done this—studied the old and then developed out of it their own distinctive methods.

ROYAL INSTITUTE OF ARCHITECTS OF IRELAND.

THE annual meeting of the Royal Institute of Architects of Ireland was held at Dublin on December 6th, Sir Thomas Drew, R.H.A., presiding.

Mr. W. M. Mitchell read the report of the Council for the session 1899-1900. It stated that a representation was made to the officials of the Irish Government that in the Local Government (Ireland) Amendment Bill provision should be made that all persons appointed by county, urban, or district councils as architects, engineers, or clerk-of-works, should be duly qualified for their respective undertakings. The late Chief Secretary replied to such communication that the Institute "should bring before him instances in which improper appointments of this kind were made." They might notice the irrelevancy of such a request to the obvious duty of the framers of an act to secure efficiency of public service when pointed out, and in disregard of the experience that there was a tendency in rural councils to make appointments of persons entirely untrained and unqualified for expert service, involving waste of public funds and bad administration of public duties. The instances before the Local Government Board as conveyed by reports in the public press of the earliest working of the Act, which should have been noted by it, were sufficient. The report also alluded to the Queen's visit in April last, and claimed that the decoration of the streets made a precedent for the controlling influence of the architect over the operations of the modern contractor for city embellishment on such occasions of State. The Council recorded with gratification the knighthood of the president as a royal recognition of architecture. In reference to the subject of building contracts the Council conceived that the general conditions of contract approved by the Royal Institute of British Architects should be the basis for reformed conditions of contract, and that uniformity of usage throughout the kingdom so far as possible would strengthen the legal position of the builder especially.

On the motion of Mr. J. R. Carroll, seconded by Mr. W. Kaye Parry, the report was adopted. The President, having alluded to the conferring on him of knighthood, which he took as an impersonal recognition of the art of architecture, proceeded with his address on "The Insularity and Effacement of the Irish Architect." In the rapid change of universal society he felt bound to notice the increasing number of some architects—not of Ireland—who had to practise in their midst. Their policy, if they would turn back the tide of friendly invasion, was to play at returns, and put Irish architects more in evidence in the general affairs of the profession of the kingdom at large. The Irish architect failed to exhibit his interest and critical faculty in works of Imperial concern. He was not ambitious in communicating his works by published illustration or by exhibition to an outside world; and while the literature of architecture was every day increasingly enriched by authorship of architects in publications, the Irish architect—with no lack of sufficient ability—did nothing to add to the store, or to advertise the Scholarship in Architecture of any architects in Ireland. It might not be, perhaps, granted to the elders of their profession to see a reciprocity spring up under which the Irish architect, famous as some sort of specialist beyond Dublin, might be called in his turn to do service on the other side of the Channel. There was a hope, however, arising in the spirit of a new generation of younger architects—in the enthusiastic movement for better architectural education of an Architectural Association of Ireland, which it was the delight of their elder brethren of a past tradition to encourage and applaud—that by every legitimate means of competition a school of architects of Ireland might hold its own among the allied societies of the kingdom of the future. A new century opens with the spirit of healthy and hearty rivalry in all manner of play of "return matches." It had been his earnest advice to those who seemed in earnest in producing more proficient architects in Ireland to play up for the credit of their Irish side in architecture in matching themselves against the healthy rivalry of those schools trained elsewhere—to be better draughtsmen, better scholars, better men of a universal world. And he might add if it were necessary to be forward players too, not wanting in cool audacity or self-assertion, or confidence in their own superlative powers—why not? He had a hesitation in saying, however, knowing his young countrymen as he did, that the last advice was absolutely called for.

The following elections took place: Secretary, Mr. Parry; treasurer, Mr. Owen; council, Messrs. Ashlin, Carroll, Geoghegan, M'Carthy, Mitchell, Murray, Sheridan, O'Callaghan; auditors, Alberry and Wrenn.

Engineering Notes.

Artesian Wells.—The artesian bore has been working wonders in Australia of late years. In the Kyoona district of Queensland lately a bore was worked down as far as 2,500ft. before the precious water was struck, but once the tap was opened a steady flow of over a million gallons a day was obtained. This ought to encourage the Government to carry the artesian tapping system into every part of the colony affected by drought in the bad seasons.

Society of Engineers. — The forty-seventh annual general meeting of the Society of Engineers was held on December 10th at the rooms of the Society, 17 Victoria Street, Westminster. The chair was occupied by Mr. Charles Mason, vice-president, who announced that the hon. treasurer, Mr. George Burt, had presented to the Society a president's badge of office in gold and enamel. He also announced the premiums that had been awarded by the Council for papers read during the past session. Of these the president's gold medal goes to Mr. Henry C. H. Shenton for his paper on "Recent Practice in Sewage Disposal."

Large Gas-Engines for Central Stations.—In the course of a lecture before the Institution of Mechanical Engineers on Friday last, Mr. Herbert A. Humphrey stated that during the next few years the design and erection of large central power-stations for the generation and distribution of electric energy in bulk promise to be the most important and interesting problem with which mechanical engineers in this country will have to deal. Central-station work in this country, so far as the magnitude of the undertakings is concerned, is undoubtedly behind when compared with American and Continental practice; but the future development promises to be on an unparalleled scale. The schemes for supplying electricity "in bulk" recently considered by a Select Parliamentary Committee may be the beginning of even greater things; and it is to be hoped that the short-sighted policy of municipal authorities will not be allowed to interfere with the progress of a movement destined to become of national importance. The sale of electricity in Great Britain is now three times what it was four years ago. The great additions to our central stations in the future will not be for lighting or tramways but for manufacturing purposes. When electric energy can be generated and distributed at such a cost as to displace the use of the steam-power plants now operating in manufacturing works, the inauguration of a new era of centralisation in the supply of power will have commenced, the importance of which cannot be over-estimated. The average total cost of a unit of electricity generated by electric-supply undertakings in this country for 1898 was 2·81d., of which the expenses of generation amounted to 1·79d.; but those who know the actual cost of steam power generated on manufacturers' premises will appreciate how much this figure must be lowered, if the manufacturers are to be induced to take electric energy in bulk from outside companies. Unless the price is reduced to something like ¾d. per unit, only the smaller manufacturers will benefit by the wholesale adoption of current for power purposes supplied from central stations, and power gas and large gas-engines give the solution of the problem.

LONDON COUNTY COUNCIL.

AT last week's meeting of the Council the Housing of the Working Classes Committee submitted their report in reference to the proposed housing scheme at Norbury. Some details of this scheme were given on p. 329 of our issue for November 28th; but, briefly stated, it is contemplated to erect upon the 31 acres of land to be purchased 551 single cottages and 211 double cottages. In their report upon the financial bearings of the proposal, the Finance Committee pointed out that the total contemplated capital expenditure was £269,005, whilst the total nett rental out of which interest and sinking fund on capital outlay would have to be provided was £10,584. Upon these figures, taking interest at 3 per cent., it would appear that when all the buildings were completed there would be an estimated annual surplus of about £470. The estate would take about five years to develop. The Housing Committee now simply recommend that the Council should purchase the 31 acres of land and certain brickmaking plant for £20,000. A debate followed, which lasted nearly three hours, but eventually the recommendation of the Committee was adopted. The Parliamentary Committee advised the Council to approve the London Water (Purchase of Companies) Bill, and that a petition be presented for leave to bring in the Bill. They also recommended that the Metropolitan Water Companies (Amendment of Acts) Bill be approved. The Purchase Bill was practically the same as last year, one or two alterations having been made to meet the views of the Royal Commission. The Committee's report was agreed to. It was further resolved, on the recommendation of the Public Health Committee, that letters be addressed to the Local Government Board and the Water Companies, expressing the Council's desire to be heard at the forthcoming enquiry with regard to the amended water regulations, and that a conference with representatives of borough councils be convened. On the recommendation of the Parks Committee it was agreed that in consideration of the payment of £5,000 the Council should transfer to the Committee the portion of the Falcon Court area, measuring 1,588 sq. yds., cleared under the Housing of the Working Classes Act, for the purpose of an open space. The Council instructed the Comptroller to apply to the Treasury for approval of the expenditure of sums amounting to £27,000 on the provision of additional office accommodation at 25 Cockspur Street.

Builders' Notes.

The Northern Lock-out.—The master builders of the Hartlepools have resolved to lock out their men to-day. The employers state that they have very reluctantly come to this decision, but have been forced into the position by the action taken at Newcastle. About 300 men are affected. Some of the smaller masters are, however, stated to be holding aloof.

The Wakefield and District Master Builders' Association.—At the monthly meeting, Mr. E. A. Elvey (President) in the chair, reference was made to the death of Mr. John Newsome (of the firm of Messrs. Newsome and Johnson), a member of the Association, and on the motion of Mr. George Crook, seconded by Mr. J. B. Hesling (Messrs. Abson and Hesling), and supported by the President, a vote of sympathy and condolence with the widow and family of the deceased member was passed.

New Medical Buildings for Dundee are to be erected on the grounds of the University College. Mr. J. Murray Robertson is the architect. The site selected is that on which the old church in Small's Wynd stands, and at present utilised as a museum and for other purposes by the students. These old buildings will be demolished, and in their place will be erected a building rectangular in shape and four storeys in height. The floors will be carried on pillars, an arrangement which is understood to be conducive to the prevention of vibrations, which interfere with delicate medical instruments. It is believed that the new buildings will involve an expenditure of £15,000.

Mr. Wm. Brown, an ex-Alderman of Salford, died recently at the age of 77 years. He first entered the Salford Town Council in 1869, was elected an Alderman in 1876, and retired from municipal life in 1895. He had been a justice of the peace for the borough of Salford since 1886. Mr. Brown was the founder and senior partner of the well-known Salford firm of Messrs. Brown and Sons, builders and contractors, who secured the whole of the contract for the building of the Hotel Midland, Peter Street, Manchester. They also built the Regent Theatre, Salford, and the just completed Victoria Theatre, Broughton.

New Fire Prevention Testing Station.—Mr. E. O. Sachs, Chairman of the British Fire Prevention Committee, announces that the Testing Station will henceforth be near Royal Oak Station on the Metropolitan Railway, and within easy reach of the Great Western and the District Railways, Paddington and Praed Street Stations and the Central London Railway Station at Queen's Road, Bayswater. The Testing Station will again comprise a large, old-fashioned house with considerable grounds, and the house is being immediately arranged for the purposes of committee rooms, a museum and a laboratory, as well as apartments for the resident engineer. It is anticipated that the testing operations will again commence in the early spring, and applications for tests can now again be received at the secretary's offices, 1 Waterloo Place, Pall Mall, London, S.W.

A Solvent Bankrupt.—The estate of Mr. Charles Lewis, of Witham, painter, plumber, and builder, has been wound up most energetically and successfully by Mr. Fred Taylor, auctioneer and valuer, and estate agent, of 17 Duke Street, Chelmsford, less than four months from the date of his appointment as trustee of the property of the bankrupt, a dividend being paid of 19s. 6d. in the pound. This is almost a record in bankruptcy working, and the Committee of Inspection have passed a resolution complimenting Mr. Taylor upon the careful way he has attended to the realisation of the estate. The debtor in this case absconded, and in view of the estate turning out so well the warrant for his arrest will probably be annulled. In fact, nearly all the assets have realised more than the sums estimated, the debtor's wife and sons doing their best to help in every way. It would look as though someone was reprehensible for their action in forcing a solvent man into this position, causing on a small estate, realising only £1,915 17s. 9d., a cost of realisation of £340.

New Patents.

These patents are open to opposition until January 21st.

1899.—Bascule Lift Bridges.—23,211. J. P. COWING, 275 Prospect Street, Cleveland, Ohio, U.S.A. This bridge (which is on the same principle as the Tower Bridge) is raised by driving the rollers on which the end of each span rests.

1900.—Hospital Sinks.—641. J. SHANKS, Tubal Works, Barrhead, N.B. The sink is similar in form to a pedestal water-closet and is provided with a ledge on which bed pans can be laid for cleansing by means of a water jet. Another part of this invention relates to a scalding or sterilising sink, which can be made separate from the closet, or formed with it. A perforated steam coil is employed.

Paving.—13,363. J. BEHMER, Rademachergatan 290, Eskilstuna, Sweden. The machine which forms the subject of this invention is mounted on four wheels, and consists chiefly of a ram or hammer which is moved up and down by levers, which receive their motion from wheels and belts. The machine is adapted for ramming paving material of all kinds, and, if a chisel-shaped tool is substituted for the ram or hammer, can also be employed for working stone.

The following specifications were published on Saturday last, and are open to opposition until January 28th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—23,091, COLE, valves. 23,209, LIVERSEDGE, refuse destructors. 23,415, 23,415A, 23,415B, 23,415C, NAEF, method of and apparatus for treating solid materials applicable to the manufacture of gas and for other purposes. 23,432, KIENY, generators for the production of acetylene gas. 23,816, CHESTER AND EDWARD CHESTER AND CO., crushers for ore and other materials. 24,216, COWEY, self-closing taps. 24,480, TAYLOR, furnaces and fireplaces. 24,496, MOSELEY, means for forming a protective coating on iron and steel wire, rods, &c. 24,567, STEVENS, MAJOR, STEVENS, AND STEVENS, controlling apparatus for electric lifts. 24,568 BATLEY, lever hand-press used in brickmaking. 25,009, BOULT (*Perrier*), apparatus for the production of gas. 25,145, SHOOSMITH, wood-block flooring. 25,704, SHANKS, baths, lavatories, &c. 25,741, WURTS, lightning arresters.

1900.—422, JONES, appliance for use in drawing. 469, MILLS (*Dugon*), machine for cutting glass. 602, WINTERFLOOD, water-heaters. 1,267, BRODIE, permanent way for tramways. 1,901, MEHRTENS, firegrates for furnaces. 1,915, DE CAUDEMBERG, composition for use in paving roads, footways, &c. 2,021, HARVEY, joint for closets. 2,103, HARRISON, window fastener. 2,395, BOULT (*Sanda*), elastic packing for flanges and joints. 3,331, NÜESCH-SAXER and NÜESCH, apparatus to prevent the freezing of water in pipes. 5,788, CLIFTON, hand sawing-machines. 8,139, WINTERFLOOD, water-heaters. 12,714, LINKLETER, cowls. 12,734, WISE (*Francis*), taps or faucets. 12,782, FERGUSSON, closets and latrines. 13,029, KOEPFF, mould-box for bricks and slabs. 13,735, THOMPSON (*Jordan*), pipe couplings. 14,198, BALDWIN AND BALDWIN, stop valves and automatic valves. 14,317, BRABY, window-sash fastener. 16,699, BRITISH THOMSON-HOUSTON CO. (*Bell*), lightning arresters. 17,043, TAYLOR, combined door checks and closers. 17,499, BRUNS, moulding machine for tiles. 17,686, WADSWORTH, manufacture of prism glass. 18,207, ASHER, window-sash fasteners. 18,369, HIGGINS AND SAFETY-TREAD SYNDICATE, LTD., construction of step for staircases of all kinds. 18,433, CHARMAN, folding ladders or stages. 18,463, ROOT, lifts or elevators. 18,808, MCRAE, ventilators. 18,952, WEHLING, process for the production of mosaic pictures. 18,973, HADDAN (*Meinecke and Co.*), urinals. 19,011, PAGE (*Bacon Air-Lift Co.*), water-raising apparatus.

Quarry Notes.

A Granite Memorial.—An elaborate sculptured marble tablet, on a polished Scotch granite background, has just been erected in Paddington Chapel by the congregation in memory of the late Rev. G. D. Macgregor (who was for thirty years the pastor of the church) and of Mrs. Macgregor. The memorial has been designed and executed by Mr. E. J. Physick.

French Slate Quarries.—The French Ministry of Public Works exhibited a complete collection of its publications at the Paris Exhibition, and amongst these was a map of the French quarries, giving the output for 1898. The slate quarries are worked chiefly in the departments of Maine-et-Loire (250,000,000 slates, representing 115,000 tons) and Ardennes (130,000,000 slates, or 51,000 tons).

The Slate Industry of the United Kingdom in 1899 is summarised as follows: Production, 639,840 long tons, as against 668,859 tons in 1898; exports, £186,921 against £187,781; imports, £338,144 against £329,201 in 1898. Of the exports in 1899, Germany received the largest amount—£127,570. Of the imports, £253,976 came from the United States, as against £267,479 in 1898.

Of the Welsh Slate produced Last Year, rather more than three-fifths was from open quarries and nearly two-fifths from mines. The two largest open workings are the Penrhyn Quarry, producing 110,000 tons annually, and the Dinorwic Quarry, Llanberis, 95,000. The largest underground workings are those belonging to the Oakeley Slate Quarry, Limited, at Festiniog, with an output of close upon 55,000 tons last year.

Converting an Ordinary Bolt into a "Lewis." A device for converting an ordinary bolt into a "Lewis" for embedding in stone has recently been introduced by Messrs. Ransome and Marshall, of Tithebarn Street, Liverpool. It consists of a block of cast iron, rectangular in section and tapered, with several deep grooves cut round it. It is embedded in the same manner as a jagged bolt, and holds quite as firmly, while obviating the necessity for special forging.

Output of Belgian Quarries in 1899.—The following table gives the total output of various kinds of stone in 1899 at the quarries of Brabant, Hainaut, Namur, Liége, Luxembourg, and Limbourg:—

—	Quantities.	Value.
		francs.
Quarry stone, cubic metres ..	139 294	16,245,730
Pudding stone, cubic metres ..	200	27,000
Lime, rubble, and broken stones, cubic metres	3,238 875	13,675,125
Paving stones in number ..	114,103,900	11,182 065
Flags and paving tiles, c. metres	144,303	636,755
Marble, cubic metres	17,740	3,005,850
Slates, number	44,167,000	1,78 8,800
Slates, cubic metres	200	1,760
Stone for sharpening scythes and sickles, in number ..	82,100	70,800
Grindstone, cubic metres ..	450	13,000
Stone earth, cubic metres ..	195,505	389.780
Dolomite	56,400	99,100
Ochre, m. tons	300	6,000
Plastic earth, m. tons	291,125	1,994,840
Tufa stone, cubic metres ..	21,500	67,000
Marl and chalk, cubic metres ..	351,800	577,700
Sand, cubic metres	627,770	1,208,490
Flint for stoneware, c. metres ..	85,185	103,480
Flint, gravel, and stones for road cubic metres	258,835	609,180
Baryta sulphate, m. tons ..	25,900	181.300
Felspar, cubic metres	1,525	16.756
Phosphate of Lime, c. metres ..	193,090	1,710,900
Pho phatic chalk, c. metres ..	237,090	1,837,350
Total	—	55,448,745

This table does not include the two Flanders and province of Antwerp, which only supply *tertiary* clays for bricks, paving, and roofing tiles, and sand belonging to the same formation and employed for glass-making, &c.

This gives an increase of 2,648,815 francs on the value realised in 1899, namely 52,799,930 francs. During the year 1899, 1,601 quarries were worked almost exclusively in the Walloon district of the kingdom, 1,177 of the number being open, and 694 subterranean. The number of workmen employed was 36,931.

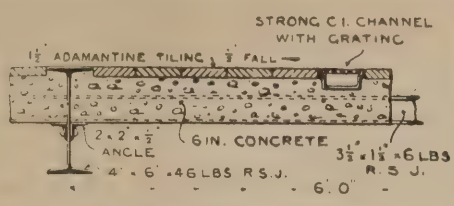
Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Protecting a House against Lightning.

LLANGOLLEN.—ELECTRIC writes; "A lightning conductor is carried up the gable-end of a house to a little above the chimney-pots. It is bent to pass the rainwater gutter at the roof level, but is kept an inch or more away from it. After entering the earth it passes underneath a gas-pipe and ends 2ft. below the surface. The rod touches the cap of the chimney, but stands clear everywhere else, copper brackets being used to hold it in position. Is this arrangement satisfactory and safe?"

The arrangement described by querist is neither satisfactory nor safe. The proximity of the conductor to the guttering is a source of danger, as it might cause divergence in the downward course of the electric fluid—through the attraction of the iron guttering—and result in an accident. Some authorities have advocated a connection from the rod itself to any adjacent ironwork so as to prevent any sudden break in conveying the discharge passing along the conductor to the earth; this is, however, attendant with some danger, as it is impossible to tell how far the electric fluid would travel before being safely dispersed. The position of the gas-pipe mentioned is decidedly too near the rod to be safe—for the same reason. It is obvious that the copper brackets should *not* be attached to the barge board, as indicated by querist. Carrying the conductor 2ft. below the earth is not sufficient; 4ft. or 6ft. is a better depth, and the rod should be embedded at its termination in, say, coke—not charcoal—the object of which is to keep the surrounding earth in the best condition for receiving a discharge. The angle of about 45 deg., at which the rod enters the ground, seems somewhat rapid. Generally speaking, it is best to carry the rod through insulators at a greater distance away from the building, say, 6in. or 8in., unless, of course, there are structural objections to this. The object of a plate at the bottom end of a lightning conductor is to diffuse the current so that it may reach the earth as quickly as possible and become absorbed in the surrounding coke, &c. According to this theory, the larger the plate the better (of course in reason). C. E. S.



Books on Building Mechanics.

GLASGOW.—NORMA writes: "Which is the best and most easily understood book on how to calculate the strength or carrying capacity of steel joists, cast-iron columns, &c.? I do not know anything of mathematics, so I presume would require also to study this subject. Which book do you recommend?"

"Rivington's Notes on Building Construction," Part IV. (Longmans and Co., price 15s.), deals most clearly with calculations for building construction, and has the advantage of avoiding as far as possible the use of advanced mathematics. The methods are explained chiefly by the drawing and measuring of lines, and in order to understand them the calculations given require but a very slight knowledge of mathematics, which we presume our correspondent possesses. He would do well, however, to study elementary algebra, mechanics, and trigonometry from such books as Hall and Knight's "Elementary Algebra" (Macmillan and Co., 4s. 6d.), Briggs' and Bryan's "Elementary Text-book of Mechanics" (Clive and Co., Booksellers' Row, Strand W.C., 3s. 6d.), and Lock's "Elementary Trigonometry" (Macmillan and Co., 4s. 6d.).

Joists for Stable Floor.

HEXHAM.—X. Y. Z. writes: "I have a stable floor to lay on the first floor, and I purpose to put a steel joist every 6ft., that is, to every stall; the span is 23ft. What would be a

JOISTS FOR STABLE FLOOR.

proper section for the joists, and would it be necessary to put lighter joists between; also, what thickness of cement-concrete would be necessary for the floor? The floor beneath is divided into stalls, similarly to the first floor, and the stall posts would afford some support to the main joist."

$23 \times 6 \times 2 = 276$cwt. $= 13\,8$ tons, say $14 \times 6 \times$ 46lbs. rolled steel joists, 6ft. apart, with cross joists $3\frac{1}{2} \times 1\frac{1}{2} \times 6$lbs., 2ft. 6in. centre to centre. Concrete of Portland cement and ballast, 1 to 5, 6in. thick, resting on $2 \times 2 \times \frac{1}{4}$ angle-irons riveted to main joists. HENRY ADAMS.

Yellow Deal and Yellow Pine.

NEWBRIDGE, CO. KILDARE.—JUNIOR writes: "What is the difference between yellow deal and yellow pine? Which is the more generally used for flooring?"

The following is a list of the synonyms used by the timber trade for the class of timber known variously as fir, pine, and deal:—

Baltic Fir Baltic Pine Northern Pine Scotch Fir Red Deal Yellow Deal	All refer to the wood of *Pinus sylvestris*	Both European trees.
Spruce Norway Fir White Deal	To the *Abies excelsa*	
Canada Pine Red Pine American Deal	To the *Pinus resinosa*	Both American trees.
Yellow Pine Weymouth Pine White Pine	To the *Pinus strobus*	

Surveyors' Institution Examinations.

LONDON, W.—T. D. W. writes: "What knowledge should I have to acquire to pass the examination of the Surveyors' Institution? I am a bricklayer by trade holding a position as clerk of works. What is the examination fee?"

Apply to the Secretary of the Surveyors' Institution at Great George Street, Westminster, S.W.

Books on Architectural Details.

HESSLE, YORKS.—X. Y. Z. writes: "I am anxious to know of a good book on measured drawings of architectural details, particularly church architecture. Can you name one?"

"Details of Gothic Architecture" measured and drawn by J. K. Colling, £2 2s. nett; "Abbey Square Sketch Book," £3 nett; "The Architectural Association Sketch Book" (several volumes have been issued at £1 1s. each). These books can be obtained from Mr. B. T. Batsford, 94 High Holborn, W.C.

Mathematics Self-taught.

SHEFFIELD. — ARCHITECTURAL STUDENT writes: "Is it possible or advisable for a person to study mathematics by self-instruction, and if so what books would you recommend?"

It is quite possible to work up mathematics by oneself, but it requires perseverance. Bridge's "Algebra for Beginners," if still in print, is cheap and simple. Higgs' "Algebra Self-taught" (Spon 2s. 6d.) is also suitable for a beginner. After these any school algebra may be taken; then Adams' "Practical Trigonometry for Engineers, Architects and Surveyors" (Whittaker, 2s. 6d. nett). Also work up practical geometry and Euclid.

HENRY ADAMS.

Strength of Loaded Beam.

ILKLEY.—R. F. writes: "A beam 24ft. long loaded with 5 tons at 6ft. from one end, 6 tons in the centre, and 8 tons at 10ft. from the other end. Find by graphic statics the equivalent weight at the centre of the beam. (This question was set at the R.I.B.A. Final Examination held last June.)"

The equivalent weight in the centre of beam means the central load that will produce the same maximum bending moment. To find the bending moments proceed as follows:—Draw diagrammatic elevation of beam as Fig. 1 to scale of 8ft. to 1in, and number the spaces as for ordinary reciprocal diagrams. Draw the load line 1, 2, 3, 4, in Fig. 2, making the distances equal to the load applied between the respective numbers on a scale of say 5 tons to 1in. Select a pole at any convenient distance from the load line and about opposite to its centre, say 20ft., to the same scale as Fig. 1. Join the pole to the points on the load line by vectors as shown by full lines. Produce the force lines as shown by thin lines. Across space 1 in Fig. 1, and parallel to vector from point 1 in Fig. 2, draw the first line *a* of Fig. 3. From its end draw line *b* parallel to vector 2, continue with *c* and *d* parallel to vectors 3 and 4, then join the outer ends of *a* and *d* by line *e*. Parallel to line *e* of Fig. 3 draw a vector, 5 in Fig. 2, then 1-5 and 5-4 will be the reactions at ends of beam, and Fig. 3 will be the diagram of bending moments throughout the beam. To find the equivalent central load to produce the same maximum bending moment, draw the lines *f* and *g* in Fig. 3, and parallel to these draw the vectors *m* and *n* in Fig. 2; then *m n* scaled off will give the equivalent central load as 15 tons. HENRY ADAMS.

STRENGTH OF LOADED BEAM.

Stretcher Frames: and How to Mount Drawings on Them.

NEWCASTLE ON-TYNE.—B. P. writes: "I should be glad to know how strainers should be constructed, and how the drawings should be mounted on them."

The accompanying sketches illustrate the construction of stretcher frames. The material usually employed is yellow pine, though any other wood may be used. The method of jointing the corners is, as will be seen, by a plain mortice and tenon, the joint being merely an easy fit and left unsecured in any way. In order to provide for the stretching of the material with which the frame is to be covered, tapering mortices are cut as shown—one being a continuation of the jointing mortice, and the other being cut at one side of the tenon. After the material is tacked on to the frame, a couple of hardwood wedges are inserted in opposite directions in each corner, and the action of driving home these wedges causes the frame joint to open, thereby slightly increasing the external dimensions of the frame, and thus drawing its covering quite taut. The sectional dimensions of the frame stuff must be governed by the superficial measurement of the frame, the depth of the stuff being to the width as 3 to 1; 1½in. by ½in. pine is suitable for a frame about 18in. by 12in. Wedges (of beech) for a frame of this size may be about 2in. by ¾in. by ½in. For very large frames one or more muntins should be provided, and wedges should be fitted to the end of each on opposite sides, that is (say) right-hand side at top and left-hand side at bottom. No wedges would, of course, be necessary for the intermediate mortices—only to the tenons To mount drawings upon the frames the first necessity is something to mount them upon, and what this "something" is will be regulated by the size and value of the drawing which it is required to mount. For mounting plans, stout unbleached calico is very suitable; good brown holland would serve for a better class of work; whilst for valuable work, or for large areas, a close-woven canvas or "duck" would be necessary. Stretch the material tightly over the frame, and secure it by tacks to the back (*not the edges*) of the panel; then, further stretch it by driving home the wedges, and give its face a coat of size. When dry, the drawing may be mounted. Starch is the best mountant, but for heavy papers it might be advisable to add a little glue. To make the mountant, rub up sufficient of the best starch with as little cold water as possible to make a thick cream of even consistency; then add, stirring all the time, boiling water until the mass jellies and becomes semi-transparent, using as little water as will bring about the desired change. Set the starch aside to cool; when cold, remove the skin covering it, and it is ready for use. If lumps are present—the result of want of care in mixing—the mass must be squeezed through muslin. Damp the drawing slightly and allow it to stretch, then apply the mountant thinly and evenly; lightly paste the mount also, and then press the drawing to its support with a soft clean cloth. If it is desired afterwards to varnish the drawing, starch again (but much thinner than as used for mounting) will make the best "size" for the purpose. Tracings may be mounted by first attaching to the mount a sheet of white paper; ordinary white lining is suitable. Tracings, being usually coloured at the back, are somewhat awkward to manage without causing the colours to run; but it can be done by pasting the mount with the stiff starch and applying thinner starch with a flat camel-hair brush to the tracing, but the secret of preventing the colouring matter from rising is *not to touch any part a second time with the wet brush*, and to do the pasting lightly and expeditiously. Laying down the tracing is a two-handed job, and it should first be lowered at the shortest side, being then carefully dabbed into position; after being once laid it must not be moved or smudges of colour will be the result. Waterproof colours and waterproof ink are preferable for tracings which have to be mounted; but if these are not available, and it is known previous to colouring that the tracing is to be mounted, it is much the better plan to defer the colouring, which can then be done on the front, until after the mounting operation. It is easier to avoid raising the colours when the starch is used as size, as the sizing can be completed in two operations, the second application—after the first has dried—filling the voids left by the brush at the first time. H. E.

DETAILS OF STRETCHER FRAMES.

Examination Questions, Science and Art Department.

DULWICH.—X. writes: "Where can I obtain the answers to the questions set in advanced stages of machine construction and geometery, Science and Art Department? The answers required are for 1898 and 1899."

The writer supplied worked answers for many years to "Science and Art," a paper published by Messrs. Chapman and Hall, but now defunct. The connection was afterwards transferred to "The Technical World," published by Messrs. Whittaker and Co, but the writer has lost sight of it for the last three or four years, and no other published solutions in these subjects are known. HENRY ADAMS.

Darkening and Staining Oak Panelling.

DERBY.—EXCELSIOR writes: "Please explain how to stain and wax-polish new oak panelling in imitation of old oak."

Oak that is to be darkened and wax-polished is not usually stained by the application of a pigment in solution, but is subjected to the fumes of ammoniacal gas in a room, compartment, or box previously rendered air-tight by having all openings or crevices carefully pasted up. A small room or cupboard in which the work can stand upright, and from 6in. to 12in. off the floor, is preferable, as, if the articles to be fumigated are supported face downwards on bearers in a box, the marks of the bearers will show in the finished work. Upon the quantity of gas liberated, and the size of the fumigating apartment, will depend the depth of colour obtained, but if a sufficient depth is not secured at the first fuming it can be deepened by a repetition of the process, although less liquor ammonia will be required, *pro rata*, if the fumigation is completed at one operation. With a room about 12ft. by 12ft. by 8½ft. high, packed pretty full of oak joinery, we have allowed three Winchesters of liq. ammon fort. 0 880, and have found 24 hours later the whole of the gas to be spent and the work of a beautiful dark colour, the gas fumes having penetrated the surface of the wood about $\frac{1}{16}$in. The chief advantage of fumigation is the evenness of colour obtained without the grain of the wood being raised in the slightest. For superficially-applied stains Vandyke-brown mixed with liquor ammonia and thinned with water is commonly used, as is also a solution of bichromate of potassium in water; but all water stains raise the grain more or less, and a stain of burnt-umber paste, thinned with raw linseed oil and applied with a sponge, will be found far superior. Wax-polishing is performed by applying to the work, with brush or rag, a solution of beeswax in turpentine, which should be of the consistency of butter during moderately warm weather. After the wax is applied the work should be left for the turps to evaporate, and then polished by means of a moderately stiff fine-haired brush, a final rub being given with a soft woollen cloth. Some polishers prefer a proportion of resin in the polish, but it is best without. Shred pure yellow beeswax and pour turpentine over it, then stand aside till dissolved. Standing the vessel in hot water will facilitate matters, if the polish is required quickly. Oak which is to be wax-polished is frequently given a preliminary coat of "glaze," and it is perhaps a wise provision, when the stain is secured with pigments, there being less likelihood of the coating being removed by the polishing brush. French-polishers' glaze is an article of commerce, but it may be compounded by dissolving 6 to 8 oz. of *best* gum benzoin in a pint of methylated spirit. Apply with a soft wide brush. H. E.

Book on Hot-water Systems.

STAINES.—A. C. N. writes: "Kindly recommend me a trustworthy book on hot-water systems."

"Hood on Warming Buildings;" published by E. and F. N. Spon, Ltd., 125 Strand, W.C., price 15s.

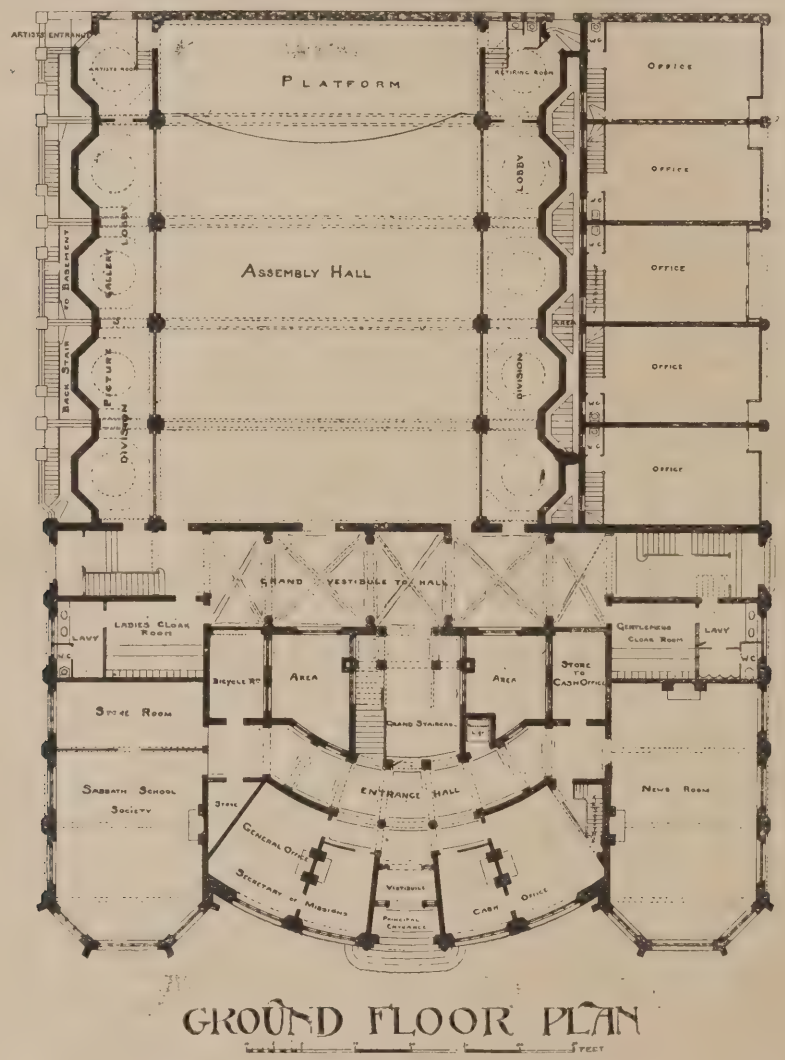
Professional Practice.

Belfast.—The intention of the architects (Messrs. Graeme-Watt and Tulloch, Belfast) in carrying out the design submitted in the recent competition for an assembly hall and offices, and illustrated on this page, was to face the work with Ruabon brick and Scotch stone dressings and to roof the building with Broseley tiles. The joiner's work throughout to be executed in best English oak, the halls to be panelled to a height of 8ft., and the walls above to be finished with enriched fibrous plaster. The grand staircase to be in marble, and the entrance and principal corridors to be paved with Roman marble mosaic. The floors throughout of fireproof constructon, and to be laid with parquetry. The general arrangement of the offices, &c., is shown on the accompanying plans. The shops facing Howard Street are in direct communication with and have access to a street in the rear. The approximate cost of the buildings as designed is £30,000.

London, W.—The Apollo Theatre is now being erected for Mr. Lowenfeld, from designs by Mr. Lewin Sharp, in Shaftesbury Avenue. The new house (which is proposed to be opened in February) will hold about 1,100 persons comfortably seated—that is to say, within about 100 of the capacity of the Haymarket Theatre. Behind the scenes the available space is made the most of. There will be a good-sized pit in the usual place and an unusually spacious gallery. The tiers being constructed on the cantilever principle, there will be no pillars to obstruct the view of the stage. In other respects the comfort of the audience has been carefully considered. In order to provide plenty of head room for the large gallery the ceiling has been "raked" down in the direction of the proscenium, but regarded from any other part of the auditorium the "rake" is not apparent. At dark numbers of small coloured windows in the front will be lighted up.

Petersham.—The Ellen Walker Memorial Church Room, which has been erected on the Bute House Estate, is a red-brick building, Grecian in style. Mr. Councillor Hasler, of Richmond, is the builder, and Mr. John Kelly, of London, the architect. The cost is estimated to be about £10,000. There is a large hall with seating capacity for about 600 persons, and a stage for theatrical performances, &c. There are four large class rooms—two rooms on each side of the large room—from which they are divided by folding screens which can be removed, making the central hall and the class rooms one hall. The ceiling of the large hall is boarded and panelled, and light is afforded by windows with folding and ventilating casements. Adjoining the large hall is a gymnasium and institute, while there are also retiring rooms, such as bath rooms, lavatories, &c., which, with the passages, are all walled with Cliff's glazed green-cream bricks, relieved with dado in brown glazed bricks. Living rooms have been provided for the caretaker. The ceilings are all boarded and painted in cream colour. The floors of the gymnasium, bath room, and lobbies are of wood blocks on concrete. Red and black tesselated floors are in vogue in the bath rooms and lavatories. The architraves of the doors and windows, &c., are of moulded red bricks, made specially for the purpose from the architect's designs. The roof of the building is covered with Westmoreland slates, and on the roof of the gymnasium is a pinnacle covered with lead. The floors of all the basement are finished in granitic cement. The fittings of the windows, casements, &c., are all in gun metal. Teale's heating and ventilating grates are in use in all the rooms. A building, adjacent to the main structure, is in process of erection for the generation of electricity, which will be used for lighting the building, while gas can also be used at any time. The entrance to the building comprises a Narthex porch, with three wide doors, which have been arranged to open outwards. A smoking room opens into the gymnasium. The gymnasium is a large octagonal room.

Portslade.—The Upper Portslade Industrial School, now being erected for the London and Brighton School Boards, will, when completed, afford ample accommodation for about 250 boys. The putting in of the foundations has almost been completed, and some of the walls are going up. The school will stand in its own grounds, 26 acres in extent, and these are being laid out by Messrs. Cheal and Son, of Crawley. A portion of the grounds will be utilized as a kitchen-garden, while another part will be used for sports. The school will be half-a-mile from the village of Upper Portslade, and overlooking Southwick, from which it is about a mile distant. The school stands back towards the south, from the Mile Oak Road, and will be approached by a new carriage way, which will also encircle the building. The outside of the latter will be 400ft. by 300ft., with a quadrangle in the centre, 119ft. by 150ft. This will be used as a playing ground by the boys, and will be surrounded by a covered-way, connected with all the corridors, and furnished with a covered playing shed on the north side. The rooms on the south side will comprise the dining-hall, school-room, class-room, reading-room, office, and the Superintendent's quarters. On the east side will be the tailors' work-shops, laundry, needle-room, wash-house, stores, larders, kitchen, scullery, &c. On the north will be the gymnasium, 50ft. by 24ft.; the swimming bath, 40ft. by 20ft., and 4ft. deep; the boiler-house and coal stores. The rooms on the west side will comprise the carpenters' and painters' work-shop, band-hall, shoemakers' work-shop, private baths, lavatory, the labour-master's sitting-room, and the schoolmaster's sitting-room. Mr. George Butt is the clerk of the works. The architects are Messrs. Thomas Simpson and Sons, of Brighton.



DESIGN FOR ASSEMBLY HALL AND OFFICES, BELFAST. GRAEME-WATT AND TULLOCH, ARCHITECTS.

The Next Issue of "The Builders' Journal" (dated December 26th) will be on sale throughout the Kingdom on Monday, December 24th.

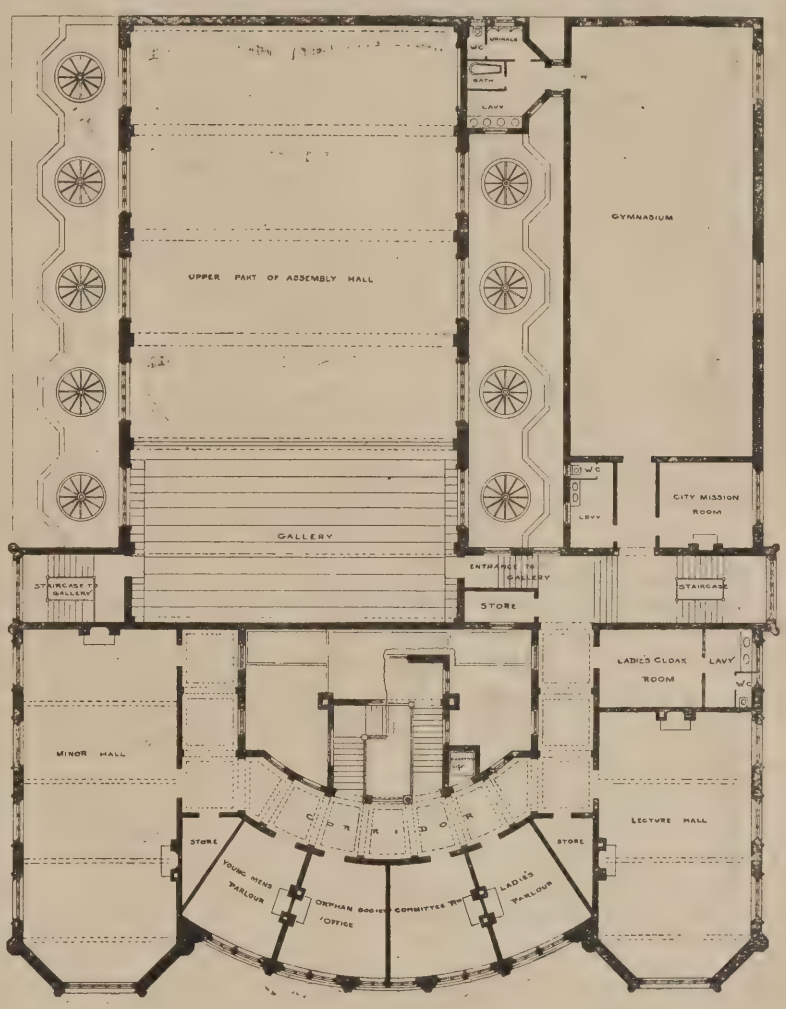
Law Cases.

Claim for Building Extras.—At the Leicester County Court Messrs. Jones and Newitt, builders, recently sued Albert Buswell, a coal-dealer, for £31 13s. 10d., for work done. Defendant admitted owing £6 15s. 6d. Plaintiffs' case was that they entered into a contract with defendant's aunt and uncle to build a house, which was to become defendant's property, for £480. If any extra expense was incurred, defendant was to pay it, and, according to plaintiffs, defendant agreed to this. Extra expense was incurred to the amount claimed. Plaintiffs had offered to have the case submitted to arbitration, but defendant refused. The defendant's case was that some of the things charged for were never ordered, and others formed part of the contract. Judgment was given for plaintiffs for £26 12s.

DESIGN FOR ASSEMBLY HALL AND OFFICES, BELFAST.
GRAEME-WATT AND TULLOCH, ARCHITECTS.

What is a Summer House?—At the Hove Police Court on December 10th Emily Sarah Wride was summoned for contravening by-laws 9 and 62 in respect to a new building at 28 Hove Park Villas. Mr. Woolley, solicitor to the Corporation, said the building in question was 20ft. by 12ft. by 15ft., and was constructed of corrugated iron and wood. It was of great importance that the erection of improper buildings should not be permitted, and he did not think it could be seriously contended that this building conformed to the by-laws. The only possible defence might be that it was an exempted building, but, having regard to the reading of by-law 2, it could not be contended that it came within the definition of a summer house. Mr. Henry Morris, of Southampton, an architect and surveyor of 40 years' standing, expressed the opinion that the building came within the exemption in the by-laws, on the ground that it was a summer house. No less than 940ft. of air space had been left between the main building and the new structure. The magistrates were of opinion that the building did not come within the exemption clause, and they imposed a fine of £1 and costs for the contravention of by-law 9. Mr. Robson asked the magistrates to state a case, and the application was granted.

What is "Rubbish?"—The further consideration of the case of *Benjafield* v. *Wall* came on for argument on December 4th. The case was reported on page 344 of our issue for November 28th. It will be remembered that the action was brought for breach of contract in the delivering and carting away of material from the Archway at Highgate. The plaintiff was the executrix of the late Allen Albin Benjafield, who, it appeared, had in his contract with the defendant made use of the word rubbish, and in the course of the performance of the contract the meaning of the word "rubbish" was raised. The rights of the parties under the contract were affected according to the construction put upon that word, and when the case came on for hearing a large body of expert evidence was given on either side. The President of the Probate Division (the Right Hon. Sir Francis Jeune) in giving judgment for the defendant, said that the plaintiff's contention that "rubbish" in the building trade meant "brick rubbish and hard core" was not sustained by the evidence. He thought the evidence showed that the term was used by the trade in the sense of that which was inherently useless, and accordingly there was judgment for the defendant with costs. The plaintiff, however, on December 4th, moved that he was entitled to judgment even if his contract were strictly construed according to the wording of the learned Judge's judgment. The argument was then reopened, and the plaintiff contended that he was entitled to the declaration he prayed for and to damages. The President, after dealing with the arguments of counsel with great care, said that he did not think the plaintiff's contention was made out, and there would be judgment for the defendant with costs.



Workmen's Compensation: A Planing Machine. At a special meeting of the Canterbury County Court, held before his Honour Sir W. L. Selfe, Henry Simpson, joiner, of South Hackney, recently claimed £50 18s. 6d. from Messrs. Gann and Co., builders and contractors, of Whitstable, as compensation under the Workmen's Compensation Act, for injury received. Plaintiff said that on May 31st he was engaged at a planing machine, his duty being to feed the wood into the machine, while a man named Austin took the finished planks out at the other end. The planing caused a lot of shavings to get into the cogs and lever, owing to one side of the cutters not being cased in. Whilst clearing the machine, believing it was fully stopped, his finger was caught in the cogs and wound up as far as the knuckle. He called for assistance, and the machine was stopped. His medical bill amounted to £1 1s. He had been earning 45s. a week, and he claimed from June 1st to October 10th £49 17s. 6d., which with the guinea made £50 18s. 6d. His Honour, in giving judgment, said the plaintiff's claim was of course based upon negligence, and his allegation was that there was a defect in the machinery—that it was out of order, and that it had started off, after he had stopped it for the purpose of clearing away the shavings. He found it was a fact that the way the accident happened was not through the machinery having stopped and started off again, but from the fact that the strap on the loose pulley never came off properly on to the fixed one, and for that reason the machine never properly stopped at all when plaintiff began to clear out the shavings. He came to the conclusion that the lever had never been properly forced home, but worked itself right home shortly afterwards. That being the way the accident happened, what negligence could be attributed to the defendants? It was in fact quite clear to him that the plaintiff must be "non-suited" at the outset. He therefore gave judgment for the defendants.

North Wales Counties Asylum: Mr. Emerson's Award.—For some time legal proceedings have been going on in connection with the dismissal of Messrs. G. O. Ellison and Son, architects, of Liverpool, for the extension of the North Wales Counties Asylum buildings. The committee of visitors representing the five counties in the Union and the subscribers were served with a writ, a claim of nearly £3,000 having been made by the architects for alleged wrongful dismissal and for commission due on account of work done. The case was entered for trial at Liverpool Assizes in July. A counter-claim was made by the Asylum Committee through its clerk on account of the alleged negligence of the plaintiffs in carrying out and supervising the work, and also for the alleged wrongful detention by the plaintiffs of certain documents. At the desire of both parties the case was referred to Mr. William Emerson, the president of the Royal Institute of British Architects, who in September sat at Chester for over a week to hear the case. He has now issued his decision. He awards that the plaintiffs are entitled to recover against the defendants on their claim the sum of £915 1s. 6d., that the defendant is entitled to recover against the plaintiffs on his counterclaim the sum of £100, that the costs of the plaintiffs be taxed and paid by the defendant, that the costs of the defendant in the counterclaim be taxed and paid by the plaintiffs, that on payment by the defendant to the plaintiffs of the said sum of £915 1s. 6d. and of the costs plaintiffs must deliver to the defendant all drawings, specifications of the general contract, quantities and prices of articles upon which the contractor based his estimates, measurements for certificates on account, memoranda of extra work ordered and variations for the specifications authorised, adjustment of variations, and detailed quantities showing measurements upon which quantities are built up; that each of the said parties

shall pay his own costs of the referee and that each shall pay one-half of the cost of the award—namely, £365.

Damages for Nuisance due to a Stable.—An action for damages for nuisance was recently brought in the Nisi Prius Court by James Sissons, joiner and cabinet-maker, of Leeds, against Herbert Whitaker, the owner of adjoining property. The defendant, according to the statement of plaintiff's counsel, owns 1,640 sq. yds. of land adjoining the plaintiff's house, and upon it are several stables which he lets. According to the plaintiff, the stables are not properly drained, so that refuse flows towards the plaintiff's property. Nuisance is also complained of from a manure pit on the defendant's land. The nuisance is said to have caused considerable illness in Mr. Sissons's family. It was further stated that although the defendant's attention had been called to the nuisance he took no steps, and the Sanitary Department of the Corporation were communicated with in order that the nuisance might be abated by the interference of that authority. Evidence was given by the plaintiff, Mr. Thomas Winn, architect, Leeds, Mr. Spinks, lecturer on sanitary science at the Yorkshire College, and Mr. D. Dodgson, architect, Leeds. Mr. W. F. Laycock, analytical and consulting chemist, Leeds, was also called, and said that in the basement kitchen of plaintiff's house, on part of the concrete floor, he found a dark brown liquid to a depth of a couple of inches. There was a fetid odour, which by analysis he found to be due to stable sewage. Mr. Wallace, for the defence, said the field in question had been in the possession of defendant's family for many years, and the stables had been there for 30 or 40 years without any complaint. The case for the defendant was that the nuisance complained of did not arise from the stables at all, but from water flowing from an altogether different source. The new house, built by the plaintiff two years ago, was situated at the foot of an incline, down which water flowed to the Meanwood Beck, and the defendant contended that the plaintiff in digging to a depth of seven or eight feet for foundation caused a disturbance that resulted in the annoyance complained of. The judge (Mr. Justice Grantham), in his address to the jury, reminded them that the case had been tried before, and that the Court of Appeal had sent it back for re-trial on the ground that the Court did not quite understand what the learned judge had ruled in the court below. "I am," said his Lordship, "not at all surprised at that. I have said before, and I say again, that it is one of the faults of our legal system that in our Courts of Appeal nothing is known of what has taken place in the court below." The jury returned a verdict for the plaintiff, and the learned judge granted an injunction, execution to be stayed until January 13th next. Judgment was also given for the plaintiff for £25, the amount of damages agreed upon between the parties.

The Difference between Constructing and Erecting a Building.—In the House of Lords on December 10th the case of *Hoddinott (pauper)* v. *Newton, Chambers and Co. Ltd.* was heard. This was an appeal from a judgment of the Court of Appeal, and it arose under the Workmen's Compensation Act. The action was originally brought in the County Court under the Employers' Liability Act, 1880, by the widow of Benjamin Hoddinott, a riveter employed by the respondents, contractors, Westminster, to recover compensation for the loss of her husband, who was killed through alleged negligence. One Parker, a builder, had under contract completed the construction of a building in Lower Richmond Road, Putney, which was used as stables by the London General Omnibus Company. After the completion of the building the company employed the respondents to fix certain iron stays in the ground floor from girder to girder to stiffen or strengthen them. The work was performed by Hoddinott and another man on a scaffold about 8ft. or 9ft. from the ground, which was put up in the morning and taken down at night. The buildings or stables were more than 30ft. in height. On August 19th, 1898, as one of the stays was being lifted, it tilted, and striking Hoddinott threw him off the scaffold on to some bricks, and he died from the injuries he received. The County Court judge held that the scaffold was not insufficient, and that the accident was not caused by any insufficiency of the scaffold, and he gave judgment for the defendants. Counsel for the plaintiff then applied for compensation under the Workmen's Compensation Act, and after taking further evidence the judge held that the plaintiff was entitled to damages under that Act, and he awarded her as compensation £245 14s. The Court of Appeal reversed that decision, and gave judgment for the respondents, mainly on the ground that, in the words of the statute, the man was not employed on a building that was being constructed or repaired, but on a building that was being added to or altered. Lord Macnaghten, in now giving judgment, said that all the learned judges concurred in holding that the building in which the accident happened was not at the time being constructed nor being repaired, and that the respondents were not undertakers within the meaning of the Act. The ground of their decision was stated very clearly by Lord Justice Smith: "Were the ironfounders," he asked, "who put in these stays constructing the building? That cannot be," said his Lordship, "for it had already been constructed, and what was then done was only an addition to that which it had originally been contemplated would be wanted. How could it be said that the man was employed in a building which was being constructed? The construction was at an end, but some strengthening was afterwards needed to be done." He did not think that construction could be limited to the original construction. That would be in effect substituting "erection" for construction. Construction, repair, demolition—these covered, he thought, the varying phases in the life of a building from its beginning to its end. He preferred to rest his judgment on this broad ground, but he could not help thinking that something narrower would lead to the same result in the present case. One would say with the strictest propriety that a building was in the course of construction when it was being reconstructed in order to make it what it was intended to be, a firm substantial structure, capable of resisting the action of the wind. He thought that in this case the learned judges of the Court of Appeal had taken too narrow a view. If they construed the words of the Act so narrowly as to exclude one of the commonest operations of the building trade, the alteration of a building already erected, and so debarred a workman engaged in that operation from all benefit of the Act, they would, he ventured to think, violate the letter as well as the spirit of the Act. The appeal ought to be allowed with costs in the Court of Appeal, and with such costs in this House as were allowed in pauper cases, and the order of the County Court judge ought to be restored, and he moved their Lordships accordingly. Lords Shand and Lindley took a contrary view, and thought the appeal should be dismissed. The other noble and learned Lords concurred with Lord Macnaghten. The appeal was accordingly allowed.

FIRST FLOOR PLAN

DESIGN FOR ASSEMBLY HALL AND OFFICES, BELFAST.
GRAEME-WATT AND TULLOCH, ARCHITECTS.

A Cabmen's Shelter at Burton has been erected at a cost of £72 at the Bridge End, Newton Road, from plans by Mr. T. Jenkins, architect. Mr. H. Edwards was the builder.

New Liberal Club at Sunderland.—New premises for the Sunderland and North Durham Liberal Club have been built on the site of the old club in Fawcett Street, Sunderland, at a cost of £23,000.

Keystones.

Mr. Alfred Gilbert, R.A., has been elected Professor of Sculpture at the Royal Academy.

Competition for Police Courts and Fire Station at Blackburn.—Messrs. Briggs and Wolstenholme and Messrs. Stones and Stones, both of Blackburn, are the authors of the accepted design in this competition.

The Burton Workhouse Infirmary is proposed to be enlarged by the addition of two new day rooms with outside verandahs, new pantries, and enlargement of kitchen and dispensary, at a cost of £1,178. Mr. T. Jenkins is the architect.

The Tower of St. Saviour's, Dartmouth, is proposed to be repaired. The tower is stated to be in such a state that it is not possible, without danger, for the bells to be rung. It is anticipated that from £500 to £600 will be required.

Bristol Police Courts.—A Local Government Board enquiry was held recently into an application by the Town Council for sanction to borrow £12,450 for the purchase of land for purposes of street improvement, and £5,025 for the purchase of land for the extension of the police courts.

All Saints' Church, Publow, which was originally built by the monks of Keynsham Abbey, and possesses one of the most beautiful towers in Somersetshire, is to be repaired and restored. The late Sir Arthur Blomfield examined its condition, and reported that a sum of £1,750 would be needed to put it in order.

Archæological Discoveries in Greece.—The ship which was sent out to make archæological researches in the sea near the island of Cerigo has returned to Athens with the first lot of antiquities brought up by the divers. These antiquities consist of two headless marble statues, fragments of marble and bronze statues, and a bronze pugilist's head. The divers also recovered various other objects. All these antiquities are in a very damaged condition, except in the case of one hand belonging to a colossal bronze statue. The searches are continuing.

Appointment of Consulting Architect to the Government of Bombay.—The President of the Royal Institute of British Architects wishes to announce that he has been desired by the India Office to assist them in the appointment of a Consulting Architect to the Government of Bombay. The salary would be 1,600 rupees a month (*i.e.* £1,900 per annum in India, or £1,300 in England), and in all probability offices would be provided. The officer selected should be competent to assist the Government in designing and reviewing plans of important buildings. He would be required to enter into an agreement for a term of either three or five years; the engagement to be capable of extension thereafter, if so desired, and to be terminated with six months' notice on either side. Applications are to be sent in to the President not later than December 31st.

Lincoln's Inn Fields.—Mr. A. Waterhouse, R.A., writes: "There is probably no spot in London where the charms of woodland in connection with surrounding architecture can better be seen and appreciated than they are in Lincoln's Inn Fields. The London County Council discovered this, and lately purchased the rights of the surrounding proprietors in order to throw the central space with its magnificent plane trees open to the public. Much of the sun and air which comes to this central space is derived from a spacious forecourt 32ft. wide in front of the houses on the south side of the square. It is, I understand, in contemplation to bring forward the new offices of the Land Registry (60ft. high with two storeys in the roof) to within 4ft. of the public footway, that is to say, projecting into the forecourt 28ft. beyond the general building line. This would, undoubtedly, in itself materially interfere with the public gardens in the centre of the square, and would, I conceive, pave the way for the owners of all the other houses on the south side to do the same thing, and so reduce the value of the gardens as a sunny and breezy recreation ground."

A new Church at Nailsworth, Gloucestershire, has been consecrated. Accommodation has been provided for six hundred worshippers. The erection of the chancel and tower has been postponed. The portion already built has cost £7,000.

The Blackburn Exchange Hall, with the Exchange Hotel and other property, was last week purchased for about £20,000. The whole block is to be cleared away and shops, clubs, arcades, &c., will be erected on the site. Messrs. Briggs and Wolstenholme are preparing the plans.

Archæological Discovery in Cleveland.—While excavating on the north side of the Cleveland Hills some labourers of the Nunthorpe Brick Company recently unearthed the lower portion of an effigy of a knight in armour in excellent condition. It seems probable that it is an effigy of one of the Bruces—most likely that of Peter de Brus, who was a Crusader. The Bruce crest and the dragon suggest such a probability, especially as the seat of the Bruces then was Skelton Castle, no great distance from Guisborough Abbey.

Bristol Society of Architects.—The monthly meeting was held at the Fine Arts Academy, Queen's Road, Clifton, last week, Mr. Frank W. Wills in the chair. A paper was read by Mr. J. Atwood Slater on "Architecture considered from the higher practical and ethical standpoint." A vote of thanks was proposed by Mr. H. Dare Bryan, seconded by Mr. Joseph Wood. Mr. Mowbray Green, of Bath, supported the motion, which was put by the president and carried unanimously.

The new Royal Camden Theatre at the corner of Crowndale Road and High Street, Camden Town, N.W., is to be opened at Christmas. It has a stone frontage to High Street with a large dome surrounded with statues representing the various arts. Above the dome is a turret carrying a gas beacon. The body of the building is of red brick. There is to be seating accommodation for about 4,000 people. The cost of the building has been estimated at £60,000. Mr. W. G. R. Sprague is the architect. The decorations are by Waring's, of Sloane Street, S.W.

"Some Principles of Design."—The usual meeting of the Glasgow and West of Scotland Technical College Architectural Craftsmen's Society was held on Friday, December 7th, when a paper was read by Mr. Thomas S. Fraser on "Some Principles of Design." The paper was written to help craftsmen to intelligently appreciate the beauties of architecture. Artistic design was, he said, the use of architectural precedent having regard to certain principles, viz.: fitness of application, expression, proportion, repetition, variety, symmetry, gradation and contrast, these principles being applied with the designer's individualism. A discussion, opened by C. Ernest Monro, followed.

The British Archæological Association held its third meeting of the session on the 5th inst., Mr. C. H. Compton, vice-president, in the chair. A paper by Mr. T. Cann Hughes, M.A., entitled "Rambles in South Devon," was read in his absence by Mr. S. Rayson, sub-treasurer. A curious feature of the church of Totnes is a large buttress at the south-east angle of the chancel which formerly had a way through it, now blocked up. From time to time considerable discussion has taken place as to the object of this curious passage, but it is still an unsolved problem. One suggestion made is that it formed a place of deposit for the bodies of persons seized for debt. The church, which is dedicated to St. Mary, possesses, according to Mr. Harry Hems, one of the finest examples of a stone rood screen. The screen is 60ft. in length, with parcloses of a rather unusual design. It is full of light tracery and rich with niches and tabernacle work. The screen is groined only on the west side, all the tracery in the fan groining being pierced through. It was erected to the order of the Corporation of Totnes in 1460. The chief features of Dartmouth, Ashburton, one of the old Stannary towns created by Edward I. in 1285, Berry Pomeroy, Kingsbridge, Abbotskerwell, Ipplespen, and other places were also described.

Mr. James Buckley Wilson, architect, of Swansea, died on December 6th at the age of fifty-four years.

A Drill Hall at Twickenham is to be erected at an estimated cost of £2,120, towards which the Middlesex County Council has promised to give £1,412.

The Forthcoming Winter Exhibition at Burlington House will be confined to pictures and drawings made during the last 50 years by British artists now deceased.

The Victoria Hospital, Folkestone, is being warmed and ventilated by means of the patent Manchester stoves supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Workmen's Cottages at Merthyr.—The District Council have applied to the Local Government Board for sanction to borrow £15,000 to erect a number of workmen's dwellings. The rental of each cottage will be 18s. a month.

The Death is Announced of Mr. Francis Chambers, of London, at the age of seventy-one. He was elected a Fellow of the Royal Institute of British Architects in 1865, and was a member of the Council for some time. He had an extensive practice in the metropolis.

Liverpool Housing Association.—Under the auspices of this Association, a lecture was delivered last week by Mr. John Edwards on "The Common Lodging Houses in Liverpool." A series of lectures is being given in various places in the town, the object being to advocate the erection by the municipality of healthy and comfortable homes for the people. The lecturer, who is president of the Housing Association, remarked that Huddersfield was the first city in England which had undertaken the building of model lodging-houses.

An Imperial Memorial to the Soldiers who fell in South Africa is proposed to be erected in London. At a meeting of members of both Houses of Parliament, Colonial representatives, and others, it was agreed that steps should be taken to erect a building to commemorate the names of all the dead, of every rank, from every part of the British Empire, who have fallen in the South African campaign, by sickness, by wounds, or in battle. A discussion as to the exact form and site which the memorial should take was postponed until the next session of Parliament.

Correspondence.

"Ancient London."

To the Editor of THE BUILDERS' JOURNAL.

NEW BARNET.

SIR,—Speaking of Christ's Hospital in the article on "Ancient London" (see last week's issue) the author mentions the figure of the founder, King Edward VI., which occupied a niche over the entrance gate, as still remaining. Allow me to say that the statue and a portion of the gate were removed to the new home of the boys in Sussex about three months ago.—Yours truly. A. J. WATERFIELD.

A Question of Light.

To the Editor of THE BUILDERS' JOURNAL.

EDINBURGH.

SIR,—The reply to "J. S. B.," Paisley, on page 374 of your last issue, is evidently by an Englishman to a Scotsman. Scottish law is not the same as English law. There are no ancient lights in Scotland. An owner, to acquire a right of light over adjoining land, must have a servitude in his deeds conferring that right. The church windows could be built against by "J. S. B." even though they had been there a hundred years. I have had to do it often, and covered up twenty the other day. Every man is entitled to the full use of his own land. The best way to bring the trustees to the point is for "J. S. B." to fix a wooden fence on his own ground so as to obstruct the church windows, and then stand by and witness the result.—Yours truly,

EDINBURGH.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.		WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
		BUILDING.		
Dec.	21	Belfast—Abattoir	Market Committee	City Surveyor, Belfast.
"	21	New Maud, Aberdeen—Police Station	County Council	J. M. Pirie, 229 Union Street, Aberdeen.
"	21	Trawsfynydd—Alterations		W. W. Owen, British School, Trawsfynydd.
"	22	Llandilo, Wales—Alterations, &c., to House	Dr. R. D. Evans	D Jenkins, Architect, Llandilo.
"	22	Nottingham—Police Station, Fire Station, Mortuary and Cottages	City Council	A. Brown, City Engineer, Guildhall, Nottingham.

Surveying and Sanitary Notes.

The Holborn to Strand Street.—A beginning has been made with the final clearance of the Strand north frontage for the County Council's Holborn to Strand new street, nine houses, from the corner of Catherine Street eastwards, having been boarded up. Some twenty more remain, going eastwards towards Newcastle Street, but their leases do not expire for some few months yet. The walls of the older houses are plentifully adorned with the "fire-marks" of fire insurance companies, many of them long since extinct. These badges are of embossed leaden plates, originally coloured and gilt, and will be carefully preserved by the London County Council, to form part of the collections towards a future municipal museum.

A new System of Paving.—The Bingham patent paving is a combination of stone and wood, the granite and wood blocks being laid close together and grouted together with pitch by the same method as ordinarily adopted. The wood is laid at the sides and ends of the granite setts, the blocks varying with one depth of the granite blocks. The wood which has been found most suitable is Tasmanian stringy brak (Eucalyptus obliqua), a well-known hardwood, having the especial advantage of toughness. By the use of wood in combination with stone the difficulty arising from the contraction and expansion of the wood is avoided altogether. The paving has been tested in Sheffield, and is stated to be non-slippery, very durable, and cheaper than wood, and, ultimately, far cheaper and less noisy than granite. The cost of maintenance is claimed to be less than that of any other. It is also cleaner than granite or hardwood. Further information can be obtained from Mr. R. Davidson, M.I.C.E., 37 Surrey Lane, Sheffield, or from Mr. E. T. Scammell, 37 St. Mary Axe, London, E.C.

The State of London Streets.—Before the London County Council rises for the Christmas vacation it will be asked to consider an important report on the condition of London streets. The report is the outcome of the two conferences of London local authorities held to consider this subject at the County Hall, Spring Gardens, the first having been held in June and the other in November last. Since the last conference a sub-committee of the London County Council General Purposes Committee has been considering how best to give effect to the several decisions arrived at. It is proposed to communicate the resolutions of the conference in regard to improved methods for cleaning streets and collecting refuse to the City Corporation and the new Borough Councils. All the other subjects which engaged the attention of the conference are recommended for reference to one or another of the Council's committees in order that by-laws may be framed to carry them out.

New Companies.

Gas and Mechanical Speciality Company, Ltd.

This company was registered on December 6th with a capital of £5,000 in £1 shares (500 deferred) to carry on the business of gas engineers, manufacturers of gas, electric, and other lighting appliances and other machinery, &c. The first directors are S. Worsley, T. G. Marsh, and R. W. Paterson.

CONTRACTS OPEN.

BOROUGH of RYDE.
ESPLANADE AND SEA WALL.

The Corporation are prepared to receive TENDER for the CONSTRUCTION of an ESPLANADE and SEA WALL.

Plans can be seen, and bills of quantities obtained, at the Office of the Borough Surveyor, Mr. CHARLES MATHEW, A.M.I.C.E., on payment of £3, which will be refunded on the receipt of a bonâ-fide Tender, with priced bills of quantities complete.

Tenders, endorsed "Esplanade," to be delivered at my office not later than NOON on FRIDAY, the 28th inst.

Neither the lowest nor any Tender will necessarily be accepted.

(Signed) CHAS. G. VINCENT,
Town Clerk.

Town Hall, Ryde, I.W.,
December 1900.

COUNTY BOROUGH OF PRESTON.

The Corporation invite TENDERS for the EXTENSION of the POLICE STATION BUILDINGS, Lancaster Road and Earl Street.

Plans and specification may be seen at the Borough Surveyor's Office, Town Hall, Preston, and bill of quantities and form of tender may be obtained at such office on payment of £2 2s., which sum will be returned on receipt of a bonâ-fide Tender.

Sealed Tenders, endorsed "Tenders for Police Station," to be sent to me not later than 12 o'clock at noon on MONDAY, the 17th day of JANUARY, 1901.

The Corporation do not bind themselves to accept the lowest or any Tender.

By order,
HENRY HAMER,
Town Clerk.

Town Hall, Preston,
December 1900.

RURAL DISTRICT COUNCIL of DARTFORD.
CRAYFORD SEWERAGE.

The above Council are prepared to receive TENDERS for the CONSTRUCTION and COMPLETION in the Parish of Crayford of about 12,150 yds. run of STONEWARE and IRON PIPE SEWERS, varying in internal diameter from 7 to 15 in., with all necessary Manholes, Lampholes, Flushing Tanks, Ventilators, and subsidiary work complete. Also for the ERECTION of a PUMPING STATION, with Pumps and about 747 yds. run of 9-in. Iron Rising Main and necessary Gas and Electric Engines. Also for Adams's Sewage Lifts and their buildings, and for all other specified works.

The drawings, specifications, and conditions may be seen on and after FRIDAY, 28th inst., at the Office of Mr. G. H. TAIT, M.Inst.C.E. Engineer to the Council, in Lowfield Street, Dartford, on any weekday between TEN and ONE and also from TWO to FIVE, except on SATURDAYS.

Copy of quantities and form of Tender will be supplied on a deposit being made of £5, which deposit will be returned on receipt of a bonâ-fide Tender.

Sealed Tenders to be delivered on or before MONDAY, JANUARY 28th, 1901, at FIVE p.m. addressed to the undersigned at the Sessions House, Dartford, Kent, and distinctly endorsed "Tender for Crayford Sewerage."

The Council do not bind themselves to accept the lowest or any Tender, but any contractor whose offer may be accepted will be required to provide such sureties for due completion of contract as the Council may deem necessary.

J. C. HAYWARD,
Clerk to the Council.

Sessions House,
Dartford, Kent.
December 1900.

COUNTY OF WILTS.
STANDING JOINT COMMITTEE.

Builders disposed to CONTRACT for the work of BUILDING a COUNTY POLICE STATION at Cricklade, in the County of Wilts, for the Standing Joint Committee, can see the revised plans and specification at the County Offices, Trowbridge, between the hours of HALF-PAST NINE a.m. and FIVE p.m.

Copies of the revised bill of quantities can be obtained from the County Surveyor, on written application, accompanied with a deposit of £1 1s. which will be returned on receipt of a bonâ-fide Tender.

Sealed Tenders endorsed "Tenders for County Police Station, Cricklade," may be sent to the County Surveyor on or before the 10th day of JANUARY, 1901, but no pledge is given to accept the lowest or any Tender.

Builders wishing to view the site can do so by application to the Police Inspector at Cricklade.

CHARLES S. ADYE,
County Surveyor.

County Surveyor's Department,
County Offices, Trowbridge,
December 1900.

Morrison & Ingram's
SANITARY APPLIANCES.

THE "DENSITAS" CLOSET SUITE

Comprises an excellent wash down, deep-seal Closet, made in Midway Caneware, double thickness, buff out, white glazed inside, deal seat, 2½ gallons, strong Caneware Cistern, with cast-iron cover and brackets, also wrought-iron flushing pipe, 2ft. long.

Price of Suite Complete,
£8/7
Carriage Paid.

These closets are expressly designed to save cost in fixing, and are suitable for Workmen's Dwellings, Schools, Warehouses, and the like. They are confidently recommended; also made in finest Porcelain-ware —white, printed, or decorated —for cottage and villa use.

Prices and Particulars on Application.

An Architectural Causerie.

A Christmas Digression: with Apologies to Mr. Dunne.

"I SEE by th' papers," said Mr. Dooley, leaning on his chair, "that th' ar-rchitects across th' whater are havin' a high time with callin' each other lhiars an' decavers." "Architects?" asked Mr. Hennessy; "what's they?" "Ah!" said Mr. Dooley, "'tis a fine question y're puttin', Hinnissy. Yer see there's two kinds. Some ar-rchitects builds houses; others only drames an' dhraws pictures iv thim. Th' wan has so much to do in lookin' after his business, dictatin' letters, havin' dhrinks with chlients, an' sich like, that he don't find time to dhraw pictures. Now th' ither wan is not throubled with anny sich embarassmints, which ties down th' speerit iv genus, an' so he dhraws an' dhraws an' dhraws; an' as nowan wants to build his houses he's free again there. Pat O'Heary has read a book on th' subjict an' he knows all about ivirything. He says to me, 'Dooley,' he says. 'That's me,' I says. 'Well,' he says, 'th' commercial speerit iv th' age is th' rhuin iv ar-rchitecture.' 'But,' I says, 'there's O'Hagan's new saloon to conthradict it. 'Tis a fine Gothic wor-rk,' I says. An' so yer see Hinnissy, 'tis all well with ar-rchitecture so long as O'Hagan lives. But as I was sayin', they're havin' high jinks across th' whater. Th' ither week they hild a grand meetin' when wan ar-rchitect jumps up an' says: 'Mr. Prisidint, Chairman, Gintlemin,' he says, 'th' phublic is a vile thing in our sight, a thing devoid iv onny appreciation f'r thrue beauty.' 'Right,' says th' Prisidint. 'Thin, we'll iducate th' vermin,' he says. 'we'll tache 'em.' ''Tis all agreed?' asks th' Prisidint. 'I put it to this meetin' iv assembled ar-rchitects.' 'Right,' they says to a man, an' they passes a resolution callin' upon Parliamint to tache th' phublic ar-rchitecture or die. Thin another says: 'What is th' relation betwane th' ar-rts?' he says. 'None' says th' Prisidint. [A voice: 'Lhiar.'] 'Ohrder,' says th' mimber; ''Tis combination we're wantin'. Let th' sister ar-rts an' th' brother ar-rts an' all th' rist iv thim jhoin hands,' he says. 'Right,' says th' Prisidint, 'I put it to this meetin' iv assembled ar-rchitects; so they passed a resolushion callin' on ivirybody to jhoin hands. 'Th' hope iv ar-rchitecture,' says anither, 'what is it?' 'Dunno,' says th' Prisidint. 'Well, I'll tell ye,' he says, ''tis castin' all styles under our feet an' thramplin' on thim,' he says. [A voice: 'Thit's what y're doing now.'] 'My frind's a lhiar,' continues th' mimber. 'Let us sphurn all styles. O'Brien did it, an' are we greater than O'Brien, who built the candy-shop in 946th Street? I calls on ye in th' sachred name iv ar-rchitecture to do this much.' 'Right,' says one. 'Nivir,' says anither. 'By th' vintilator on th' top iv St. Paul's Cathedral,' he says, 'I'll not be pharty to sich bhlasphemy. Th' styles 've bin my bist frinds,' he says, 'an' I'll not disirt 'em,' he says. ''Tis copyism y're after,' says anither. Thin th' Prisidint rose in 'is chair, an' says that as they was all so much iv wan mind he would propose that Parliamint be called upon to see that iviryone got his share. 'Right,' says all, an' th' meetin' conchludes. Then away goes th' mimbers in cabs and 'busses to forgit all they said till th' next meetin'. Hinissy, 'tis a terrible difficult thing to make an ar-rchitect." "How's that, 'tis only drawing?" asked Mr. Hennessy. Mr. Dooley looked thoughtful for a few moments; then he replied: "Ye've hit it Hinnissy, ye've hit it. That's just what I siys to O'Heary. 'Th' thrubble,' he says, 'is in th' trainin' iv th' animiles. Do ye know,' he says, 'how they breaks in a young ar-rchitect frish f m th' stable?' 'I do not,' I says. 'Well,' he says, ''tis primal causes does it. Whin th' bhoy gits to be a rigular nuisance th' father considers what shall be his distiny. 'Th' bhoy,' he says, 'is a genus,' he says; 'see what a fine drawin' he made iv th' tool-house at th' back iv th' ghardin.' Thin he meets a friend who calls himsilf an ar-rchitect an' has a big brass plate at th' bottom iv some stairs. 'Me son,' says th' father, 'is a genus, an' if ye doubt it I'll show ye th' picture he dhrawed iv our tool-house, which looks bheautiful onny way up.' 'Right,' says the ar-rchitect, 'he is a genus, an' it only wants a premium iv three hindred pounds to make him a greater genus.' So th' father pays th' money an' th' bhoy begins to be an ar-rchitect. He goes to th' office with a b'g box iv strange tools an' a swilled head, an' if th' atmosphere isn't proper his head gits bigger an' bigger, which is generil. An' at this office he larns all sorts iv handy things, smokin' an' leanin' out iv windows an' sittin' in easy chairs an' sich like; perhaps in his spare momints he larns to dhraw lines an' circles, an' wince in a while he may make a picture iv a house, but this is sildom done now. Afhter a few years iv this he naturally becomes viry clivir an' can earhn nearly a pound iviry week. By an' bye his time is up, but th' architect says 'Me bhoy,' he says, 'you're a genus, an' I wuddn't f'r worrl's hamper ye by engaging ye to stop on' 'Right,' says the bhoy, 'I'll put a brass plate up f'r mesilf.' An' he does, but somehow or ither he can't git people to let him build houses f'r thim.' Thin he says that th' ar-rt iv ar-rchitecture has perished. But wan fine day he makes a picture iv a public-house at th' corner iv a street, with a lot iv gold letters, splindid big lamps as tall as yersilf, an' bheautiful carving over ivirthing an' ivirybody. Then all goes well afther that until ivintually he becomes a rheal ar-rchitect, builds hotels and things, dictates littirs, an' thin, as I hive said already, he hasn't time to dhraw houses hisself, so he keeps a tame man upstairs in th' back room to do this triflin' job f'r him: while all th' buddin' genuses romps about in th' rhoom below." "But what about this new street they're to make in London?' asked Hennessy. "Well," said Mr. Dooley, "I met a man only this mornin' who has bin readin' all about it. An' he says there's a fine to do over this street. Some wants to have shops an' bridges an' sich like all over th' place—Hinnissy, that's the speerit iv commercialism—but th' others won't have nothin' iv th' kind, but wants all quiet an' restrained, like O'Hagan's saloon. An' it was only whin th' chairman iv th' County Council threatened to shoot th' mimbers that they come to a decishion." "But what would ye do?" asked Hennessy. "Lave it to th' bricklayers," said Mr. Dooley. "'Tis th' spontaneous efforts iv th' bricklayers we're wantin'. There's O'Hagan's saloon to phrove it. An' if onny man calls me a lhiar——" "Half a minute," said Hennessy, "here's Mrs. Hogan with th' dinner, so let's lave it till afther th' Christmas puddin'." "Right," said Dooley, "but I must tell ye how O'Hagan's saloon was built."

R. R. P.

DRAWN BY HAROLD E. HENDERSON.

a stout piece of oak inside let into holes in the stonework and called a "stang."

There was always a large iron drop handle of varying design and ornamented with chisel-marks and foliation. Door knockers came into use at the end of the seventeenth century; before this time they were formed with a length of rope or a chain with a knob at the end. In one or two cases in Yorkshire the "thirling-pin," or rasping-pin, has been found. This consists of a length of twisted iron with a piece to slide on it to make a rasping sound. In earlier days the more important houses had a bell in a small cote over the door with a rope to pull it.

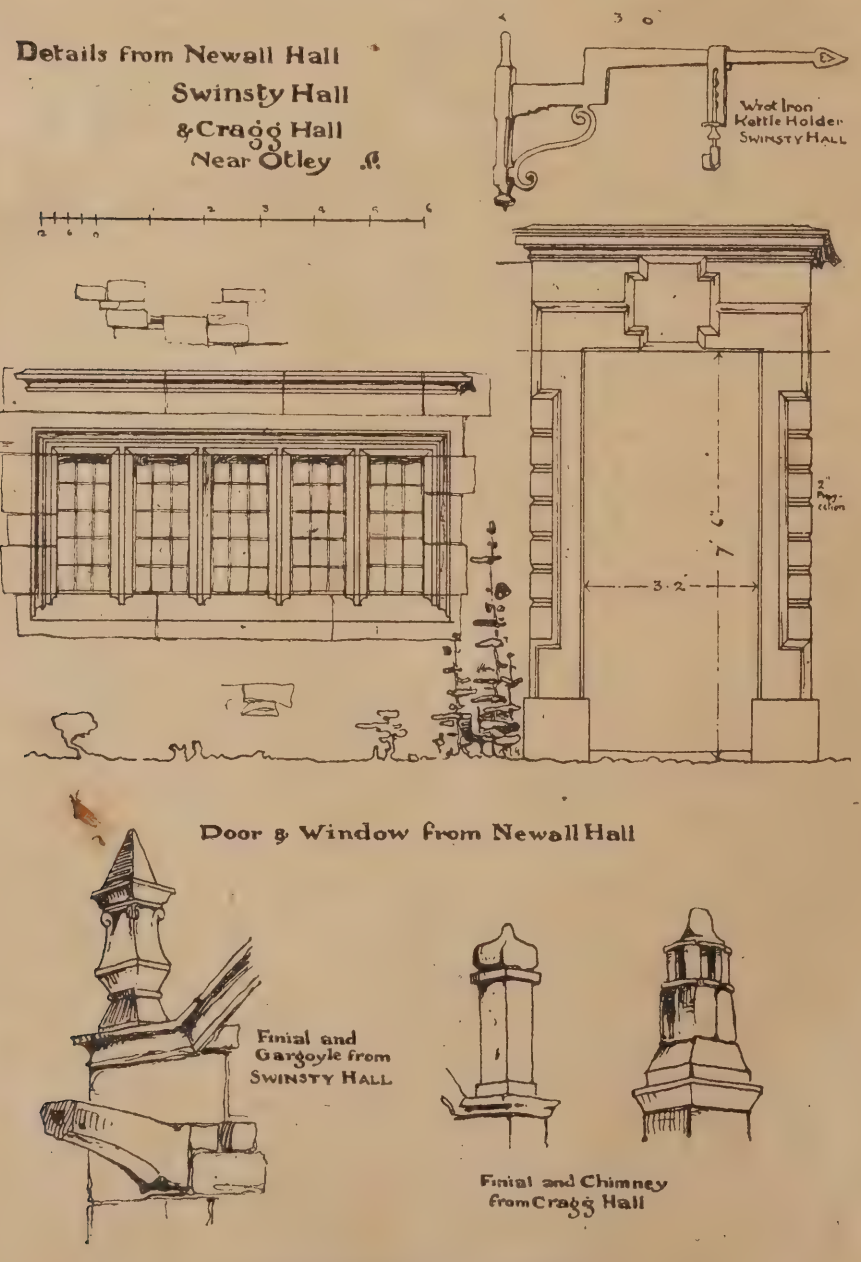
In some cases there was found in the door a squint grating, this being a small door about 6in. square protected with a close wrought-iron grille. This squint door was always opened upon the summons from the thirling-pin announcing the arrival of a comer, and if he was a welcome person the stang was drawn and he was admitted; if otherwise, he was told so. It was a very honest way, and it is a pity that it is not followed now, thus preventing the footman endangering his soul with the polite lie, "Not at home, sir."

A Short Description of the Buildings Illustrated.

Swinsty Hall, Fewston.—Up the valley of the Washburn, not far from Leeds and one mile from the village of Fewston (anciently Fuystone), stands the ancient Hall of Swinsty. Approached in the evening twilight over a wide stretch of moorland, with its dark gorse and stagnant pools of slimy green water, the home of the frog and the haunt of Will-o'-th' Wisp, or Jack-a-lantern, it has an appearance full of quaintness and mystery; indeed, this is fully carried out in its history, for its builder and his doings are both forgotten. This mystery is not only felt in the deepening gloom of evening, but is still experienced in the bright daytime. Tradition says that the Hall was built by a gentleman with not very conscientious scruples, who, visiting London during the time of the Plague, hoarded money by robbing the dead and pilfering the houses of the citizens who had died from the horrible disease; then returning to his native village he built a house at Swinsty. His former companions kept him at a respectful distance, either caused by their disgust at his manner of amassing wealth, or by fear of contagion from the foul disease. One very curious thing is the absence of a road to the house, nor is there any semblance of there ever having been one.

The projecting porch is beautiful in its severe simplicity, its rather steep gable with finials on the footstones, its rows of stone-mullioned windows and its elliptical-arched doorway making a fine composition. The door is of oak studded with iron spikes. Entering through this massive door up a few steps you enter the oak room, panelled with dark oak of the sixteenth century with a richly-carved frieze. The panes to the large mullioned window bear the initials H. R. G. 1627. A stone staircase leads to the upper chambers. One little thing worth noticing is the wrought-iron kettle-crane with finely-wrought scrolls and heart-shaped ends. There is also one of these cranes in the inn at Fewston of similar design, undoubtedly the work of the same smith. The large barn or granary, with thatched roof, where you can still hear the blows of the flail thrashing the corn, is adjacent to the Hall.

SWINSTY HALL, NEAR OTLEY (1537): GROUND PLAN.



Cragg Hall.—Not far from Fewston is Cragg Hall, nestling in a clump of trees. Grainge says: "The large grey craggs which gave name to the Hall still peer out on the steep hill-side by the road leading to Fewston." It is of the same date as Swinsty Hall—in fact, it is in some points similar—for instance, in the window moulds and the chimneys.

Oakwell Hall, Birstall.—Set back and surrounded by a low wall enclosing the garden planted with holly trees and firs you cross by a paved path to the porch with a moulded stone seat and diamond-shaped piece of ornamental plasterwork; you pass through the iron-studded oak door into the spacious vestibule of delicately yellow-washed walls, and from there into the hall. This fine room is panelled on all sides with oak and goes up two storeys, with an ornamental plaster ceiling. At both ends of the hall are galleries with balustrades of curiously-turned oak balusters. The large window has thirty lights, and is filled with diamond panes with leads 1in. wide. In one corner of the hall is the staircase, which winds upward to the galleries above and is shut off by a small dog-gate—a feature very seldom seen now, its use being to prevent the dogs from climbing the stairs.

The schoolroom is also a fine room, being panelled up to the ceiling. The chimney-piece is of stone with oak overmantel. The mullioned windows, filled with small panes, are well placed and nicely proportioned. Oakwell Hall is the original of "Fieldhead" in Charlotte Brontë's "Shirley," and is much visited in consequence. The old moat is still to be seen filled with green-looking water, the home of the toad and the water-rat.

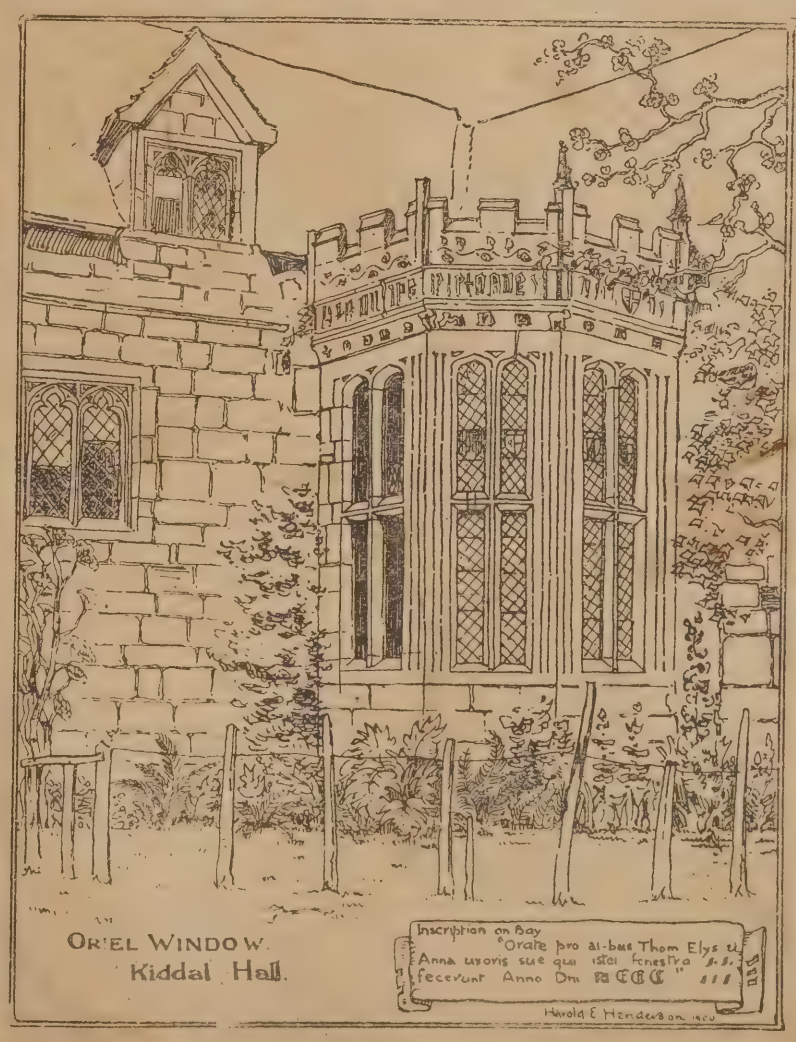
Kiddall Hall (Barwick in-Elmet).—Portions of this Hall date back to the fourteenth century, as evidenced in the tracery in some of the windows. It was anciently called Kidd Hall, and was the home of the Ellis family, who came into this neighbourhood in the twelfth century. The chief point of interest in this fine old manor-house is the beautiful bay window added in the fifteenth century. It looks as if it had been taken from its original position in the old chapel (now demolished) and planted in its present position. It is filled with diamond panes with painted glass shields, containing armorial bearings. An inscription as follows runs in a frieze below the battlement: "Orate pro ai-bus Thom Elys et Anna uxoris sue qui istei fenestra fecerunt Anno Dni MCCCC." There are crocketted pinnacles at the corners. Below the inscription is a trailing pattern of vine-leaves very conventionally treated.

On the east side of the house is a very fine bay window, long and low, with splayed mullions and roofed with stone in graduated splayed courses. Note may be made of the clever way in which the cornice of the bay is mitred with the string-course of the house, which is on a higher level than the bay cornice. The stable buildings are excellent—the laithe especially, its massive timber reaching up into the blackness of the roof.

DRAWN BY HAROLD E. HENDERSON

RECENT BUILDING IN MANCHESTER.

A FURTHER CRITICISM.

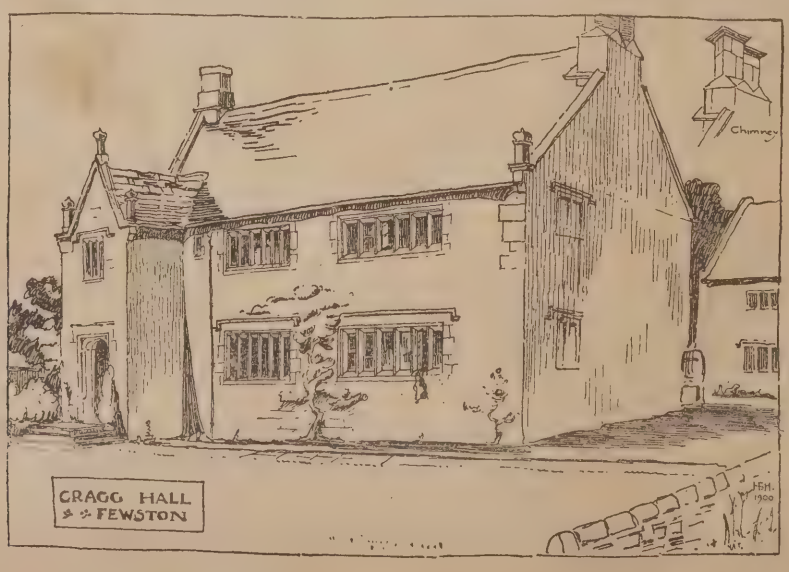


IN our issue for November 14th we reprinted from the "Manchester Guardian" a criticism of buildings recently erected in that city. The following further criticism has since appeared, which we take the liberty of using.

In Market Street the Merchants' Dining-rooms present a very good street front, much of it of fresh vigorous design and possessed of that kind of originality that comes of exceptional requirements worked out by an able hand. The shadow of the deeply-recessed arch is obtained without the effect of weakness; and the tie bar, necessary for strong construction, is satisfactorily masked. Instead of the aching void seen in most shop fronts, there is here good and artistic treatment. We should do better if we were more courageous in facing difficult problems. If an iron beam is necessary, why be ashamed of it? Why cover it up and pretend that it is something that it is not? Treat it as a friend, treat it well, and it will be found something to be proud of. Not seldom a very tolerable façade is injured or spoilt by some minor feature weakly treated. "True greatness is shown by care for little things." Even that effective and well-designed set of offices in Pall Mall is spoilt—in a degree—by the want of proper places for names, businesses, and so forth. This should always be arranged beforehand and form part of a design, as is the case, for instance, with the shops under the Royal Exchange. Or look at St. Mary's Hospital, now rising fast in Oxford Street; the name or title of the building occupies a properly conspicuous place. It forms part of the design. It gives in bold characters the needful information, and at the same time is a decoration. The monograms, too—of the Blois palace kind—are appropriate and effective. In the great warehouse hard by, the partners' names over the door—which are also raised letters in terra-cotta—are unhappily treated, being seated uneasily on uncomfortable curves. Yet in the cornice above (so high up that you may easily miss seeing it at all) the name of the firm is so treated as to leave nothing to desire.

In a general way this big building arrests attention as one of the most imposing piles in modern Manchester. It is no small merit to have the water-side front of corresponding dignity with those to the streets. The cornices, pillars and other features are bold and effective. It successfully suggests the idea that it is the place of business of a great and prosperous firm. But there are minor faults. For instance, the main central gable to Oxford Street, seen in passing from north or south, stands up alone as if more or less of a sham. The chimney at the south-west is quite unworthy of such a building. The iron railing as a cresting at the top is an excellent idea, but it is mean in design, and so is not a worthy or consistent finish. With all its merits—and they are not few—the great artistic fault of the building remains. This is a *stone* design modelled and carried out in burnt clay. This is an error for which there is no valid excuse. If a man has the imaginative faculty without which he cannot be an architect of the highest, or of a high, class, he should be able to invent the way of designing to suit the materials selected. Moreover, if our architects would devote more—and much more—time to travel and study, the gain to their reputations and to the architecture of our streets would be enormous. Sites and local conditions should be always studied. A man would not then fall into the mistakes made in the exterior of the Rylands Library, and at the west end of the Cathedral. In both cases it is as if ingenuity had been taxed to provide, regardless of expense, lurking places and abiding homes for as much dirt as possible. The main outline of the Library is effective enough, but that very intricate and minute detail is a mistake in such a city as ours. The site, too, is too small and confined for a building which represents £300,000. It was a happy boldness that set the building askew with the line of the street, and the play of the lines of the front, as seen in passing up or down Deansgate, is very good. The front railing and lamps are beautifully executed, but in looking at them closely the feeling is engendered that the details, if not the design, are from the hand of the metal worker's draughtsman rather than from that of the architect. It is inside chiefly that the poetry of architecture is realised. There is a charm possessed by very few modern buildings—a sort of superfluity of magnificence, a graceful homage paid to intellect and culture. "A room without books is as a body without a soul." Was there ever before such a beautiful body clothing such a soul? The warm soft colouring—the best sort of colouring too, that of nature—adds much to the effect of the beautiful forms. In such a palace of delight criticism seems out of harmony, yet one may wish that the designer had in some cases allowed himself a little more variety; for instance, the monotony of the pattern of the gallery fronts is a little tiring, if not irritating. Two or three patterns alternating in some way would have been a great relief.

At Old Trafford a great transformation has been going on during the last few years. Enormous piles of building have arisen, and are arising, in the neighbourhood of the Ship Canal. The engineer's work, which is chiefly inside, seems to be designed with great ability, beautifully executed and well fitted for what it has to do. As regards the outside architectural presentation it is impossible not to feel disappointment. It is a great opportunity. So far no one has risen to it. With little exception, there is no outward expression of the various purposes for which these buildings are erected; and the architecture—if by courtesy we call it so—is at the best poor and commonplace. It is not a question of more or less expense. Buildings for such purposes should be simple, and may properly be even severely plain. That, probably, is where the difficulty comes in. It needs a man of power to express



ORIEL WINDOW.
Kiddal Hall.

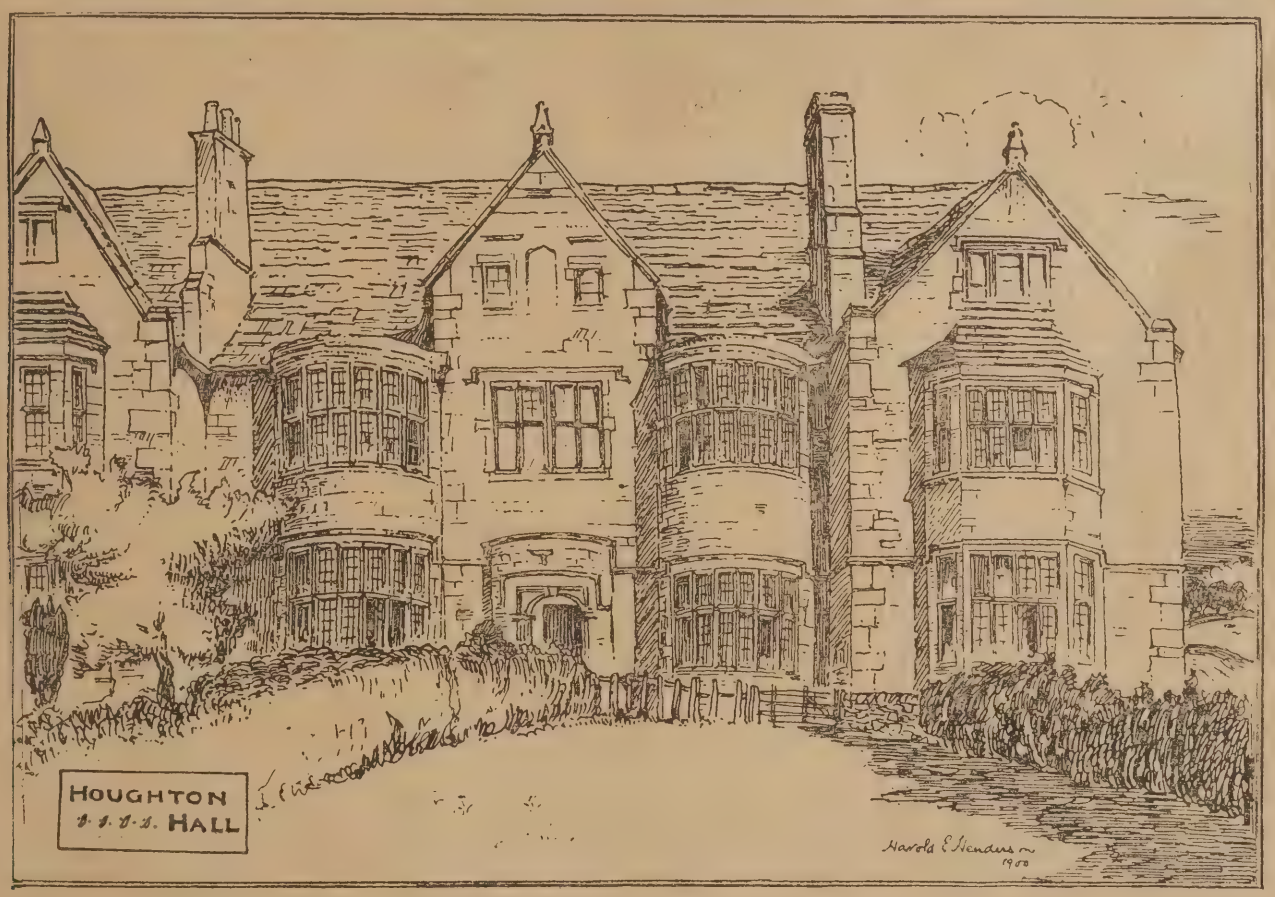
himself eloquently in simple dignified language. The great six- or seven-storey building of the Liverpool Warehousing Company does, more than most of its neighbours, express its purpose, and with more careful design in three particulars might have been a success. Had the example of St. Mary's Hospital been followed and a suitable panel or place been arranged for the name, "LIVERPOOL WAREHOUSING CO., LD.," with well-designed letters, this alone would have gone a long way to redeem the plainness and set off the whole. The second missed point is that the offices, or whatever they are, under the "salt pie" roof on the east side, are tacked on anyhow—not designed, as they should have been, to assist or make the effect of the whole pile. The third point missed is in the chimneys, which are, as usual, inferior, in two senses of the word. A little further to the west, and on the other side of the road, are the Lancashire Dynamo and Motor Company's works and offices, with a very red, an unrelieved red front, manifesting no idea of properly characteristic terra-cotta and brick treatment—a design that might with equal propriety, or impropriety, be carried out in almost any material. Even the chance afforded by the offices on the easterly side has not been utilised. They just butt up to the main building; they are not welded on to it. It is worse and worse when we come to the west side, which is of common brick, mean and poor in every way. The design and treatment have no relation to the front. Yet the conditions and requirements obviously lend themselves to a very effective building.

All over Manchester—and in every other modern-built town, for that matter—one's eye is offended at every turn by the meanness of a smart or costly front with uncomely sides and back. Yet often the sides of a house are more seen than the so-called front, and so the offence is magnified. The sight of such buildings offends the eye, as the paltry meanness which they suggest does the mind. If the cheaper and the more costly materials were mixed, and mixed well, and spread over so-called front and sides, the vulgarity would disappear. If the buildings in question were designed in perspective, the offence we denounce would be less often committed. The Mercantile Bank at Old Trafford—an unpretending one-storey building—has its bricks and stone well distributed. The detail, too, is good, and of the educated sort. But it wants incorporated in the design a better place for the name of the bank. The conditions and requirements of the Empress Brewery afford an opportunity for very picturesque and effective design without lessening the utilitarian qualities which should of course prevail. To put over the gateway an Imperial crown is a good idea, but it was surely bad judgment to make the crown (so to speak) only doll's size. The building in Market Street adjacent on its east side to the Merchants' Dining-rooms invites a word of notice. There is no vulgarity about it, but a sort of homely commonplace. This, again, is an illustration of the want of inventiveness in the use of terra-cotta. That material is an excellent servant; it should not be allowed, as it so often is, to be master.

The pavilion on the new Owens College athletic grounds has a picturesque south front. It can hardly have been designed in perspective, though, and it probably looked better on paper than in execution. Good design should go all round a building. That there should be a combination of red brick and "black and white" is good, but is it in this case quite a happy marriage? The eaves of a building in such a style as this should project well; here they are close-cropped, suggesting an effect similar to that produced by the absence of eyebrows. We have also a repetition of the fault of very red roofs upon very red walls. Purple or brown-red tiles would have made a great difference for the better. Walls and roof should never be of the same tone or the same colour. This sounds like an elementary rule. So it is; yet few keep it.

Blind School at Leatherhead.—The School for Indigent Blind is shortly to be transferred from London to Leatherhead. A site, bordering on the Highlands Road, originally forming part of the Vale Lodge Estate, has been purchased by the committee of the Corporation for the erection of a block of buildings to accommodate the 230 blind persons who are under the direct care of the Corporation. The site comprises 15 acres of land situated in the most healthy part of Leatherhead, and surrounded by some of the most picturesque scenery in the county. Although the plans have not yet been adopted, the land has been partly staked out by the architect, and building operations will commence at the beginning of the new year, and it is hoped will be completed by June, 1902. Provision will be made for an entrance lodge abutting on the main road, contiguous to which will probably be the principal's house, the main school buildings being in the centre of the site. Other buildings will comprise a chapel, sanatorium, gymnasium, baths, workshops and offices, and at the extreme boundary a 40ft. road will be formed.

RECENT LAW CASES AFFECTING PROFESSIONAL PRACTICE.*



BY JAMES CROCKER, F.R.I.B.A.

THERE are two or three classes of cases affecting us as a profession; such as actions for the recovery of fees, actions for alleged negligence in the fulfilment of duties, actions arising out of the withholding of certificates, and for penalties; besides other litigation having a bearing on building operations, although not directly as between architect and client. I shall endeavour to place a few of these before you, giving only the leading facts and results, and classifying them as well as may be possible.

I take first the case of *Burrough Hill* v. *G. A. Barnard*, in which the plaintiff (an architect) claimed from the defendant (also an architect) the sum of £8 8s. 8d., balance of an account for attending court and giving evidence in support of the present defendant's claim for fees against his client, in which, after a three days' hearing, he had succeeded with costs. Plaintiff maintained his claim to £5 5s. a day in a County Court, stating that for expert evidence of this kind he was accustomed to receive £10 10s. a day; and the judge in giving judgment expressed surprise that the claim should have been resisted. In the case of *Hutton* v. *Chorley* (heard before Mr. Justice Channell and a jury) the plaintiff claimed £147 for preparing plans, specifications and quantities for altering and rebuilding an hotel to cost £1,800 or £2,000. The lowest tender came in at about £1,200 in excess of the sum alleged to have been limited, and the defence was that defendant did not care whether the place was rebuilt or altered, so that it did not cost more than £1,800 or £2,000. Judgment for £118 11s. 3d. *Phipps and Jackson* v. *Brownrigg* was a curious claim for £526 5s. prosecuted by the widow of the late C. J. Phipps and his partner, Mr. Arthur Blomfield Jackson, for plans and drawings of a proposed theatre in the Haymarket, and, in the alternative, damages by reason of the defendant's failure to get the plans approved by the London County Council. The chief argument of counsel for the defence was that the approval of the plans was inseparable from that of the area on which they were to be carried out, and that as the site had not been finally approved, it could not be said that the plans had been. His Lordship said the matter had been shipwrecked by the action of the Council in rescinding their approval of the site; but, as that prevented the approval of the plans coming before the Council, he reluctantly gave judgment for defendant without costs, expressing an opinion that some satisfaction should have been given. *Whipham* v. *Everitt*, before Mr. Justice Kennedy in the Queen's Bench, is worth recording because of its bearing upon the scale of the Royal Institute of British Architects. Plaintiff brought an action to recover £169 16s., being 3 per cent. on £5,660, the amount of a single tender for plans and specifications for the erection of a villa at Saltburn. The defence was twofold; (1) that there was a verbal agreement that if work was abandoned the charge would be only for time occupied; and (2) that the sum claimed was excessive and unreasonable. Judgment was given for £125 and costs, being at the rate of 2½ per cent. on £5,000; the ½ per cent. for obtaining a tender being disallowed.

After quoting *Williams* v. *Edeyrnion R.D.C.*, in which plaintiff was non-suited because of the disapproval of the plans by the Local Government Board, notwithstanding their approval by the R.D.C. (his direct employers), Mr. Crocker passed on to summarise as briefly as possible the facts connected with the recovery of fees in two or three quantity cases; taking that of *Mellor* v. *Britton* for £411 before Mr. Justice Bigham, and also that of *Arthur Crocker* v. *C. J. Head* for £24 15s. 6d. In the former case the employer had employed plaintiff to take out the quantities, but when the first instalment became due to the builder it could not be met, whereupon the builder took over an assignment of all the building owner's liabilities, present and to come, and sought to argue that the fee was to have come out of a particular fund which had never come into existence; therefore he was not liable. Judgment for the full amount. In the case of *Crocker and Head*, the plaintiff had, as usual, received his instructions from the architect, it was said with the full concurrence of the defendant, but the latter denied this. The work was suddenly abandoned when the estimates came in, and the defendant settled his architect's account, but refused to entertain that of the quantity surveyor. He had, however, to pay it in full. This is not an uncommon contingency in the course of practice, and appears to prove that if an architect's instructions are to obtain tenders, he may do what is reasonably necessary in order to get them. Speaking broadly and generally, it is seldom that a recalcitrant client can escape liability for work done by an architect when there is nothing of the nature of a speculative agreement between them. On the other hand, it is by no means certain that the 3 per cent. scale can be maintained for work abandoned after the tendering stage.

In the matter of "light and air," I will refer to two cases of a typical character, which may indicate how dangerous it is under certain conditions to take away even a small portion of that in which a man enjoys the same right as he does in his freehold. May I say, first, that "air" is generally erroneously mixed up with "light," and no action can be maintained for air unless it be so interfered with as to amount to something like positive contamination, rendering it injurious to health. After quoting at length the facts connected with *Seymour* v. *The Palace of Varieties Co., Ltd.*, at Plymouth, in which plaintiff was awarded £500, the case of *Brown and Others* v. *Collings* was dealt with. The *locus in quo* was in the High Street, Bromley, Kent. The width across from the window in question to the obstruction was about 60ft., and the windows themselves were between projecting wings. Old sheds of defendant's building gave light over an angle of 12deg. The new buildings were proposed to go up to about 32deg., still leaving 58deg. of sky surface, whilst the loss of light would be 20deg. An injunction was applied for and an interim injunction granted in November, 1896. The case came before Mr. Justice Romer in (I think) June, 1897, but he would not decide, and asked for both sides to agree to have a report from an architect. This was done, and Mr. Gruning sent a report, saying, in brief, that under 45deg. no obstruction was as a rule caused, but in this case, owing to a certain window being so much recessed by back buildings, he fixed the angle of obstruction

* Summary of a paper read before the Devon and Exeter Architectural Society on December 6th, 1900.

at 33deg., and as defendant did not go so high he considered that plaintiff had no case. The judge accepted this report, and the defendant completed his building; but on appeal heard in February, 1899, this was reversed, the judges holding that *no* light previously enjoyed could be taken away, but hinting that the plaintiffs should not be too hard upon the defendant in letting him go up to a reasonable height. The result was that the latter was compelled to pull down one storey, leaving the angle of obstruction about 23deg. or 24deg. only. Thus it appears that even in a width across of 60ft., with an existing sky surface of 78deg., when there is no *lateral* light, it may be possible for a dominant owner to maintain a right to *all* the light he has hitherto enjoyed. This is rather a startling possibility.

ARCHITECTURAL INSTRUCTION IN NEW YORK AND PARIS.*

IN respect to the methods by which our ends are reached, we find ourselves, as we learn the lessons of our own experience, departing more and more in matters of detail from Paris traditions. This is what was to be expected—and, indeed, hoped for. The Ecole des Beaux-Arts is, indeed, our *fons et origio*, but the conditions are too different, there and here, for close imitation to be safe. In Paris the *nouveau* is thrown into the deep waters of the *atelier* to flounder as he may, with a dozen *anciens*, of greater or less degree of maturity, to teach him his strokes and to see that he does not hopelessly go under. By hook or by crook he picks up a knowledge of what he needs to know, finding always somebody at hand who, in requital for such services as he can render, will answer all his questions as they arise. It is an admirable system, prompt and efficient, but it requires *anciens* to work it; and *anciens*—that is to say, skilful and experienced men—would not stay in school after they had become experienced, if they had not the *Grand Prix de Rome* to look forward to. But they would not even go to Rome, and there spend three or four of the best years of their lives in further academic study, if they had not the promise of Government patronage to look forward to on their return home. It is upon this Government patronage that the whole Paris system rests. The *camaraderie* and mutual help that make the system of *atelier* instruction so delightfully efficient would be of little value without it, for the *anciens* would not stay long enough to get really old.

The Paris schools possess the further advantage that the best architects in France find leisure to take an active part in them, supplementing and completing the works of the *anciens*. This advantage cannot be had in this country. In a school like our own, all the instruction has to be given by two or three men—two or three teachers to eighty or a hundred students. The work must needs be done in classes, not man by man, and we must make up for this disadvantage by improving and perfecting our methods. For the purposes of class instruction the work has to be analysed and systematised into a series of carefully-graded exercises. In this we have made good progress and have already achieved excellent results. The more elementary work is done quite as well as it is done in Paris, and more promptly and surely. Even the more advanced work seems to be quite up to the Paris standard for work of the same grade, and considerably more uniform in excellence, as would naturally happen from the greater uniformity of the teaching. All this leads us to hope that, if the time ever comes when we can keep our men as long as the *ateliers* keep theirs—or, which comes to the same thing, can begin our work with students already advanced—it may equal also the more advanced work of the Ecole. Meanwhile, the best thing our men can do, if they want to carry their schooling farther, is to go to Paris; and that they do in large numbers, making for themselves there an excellent name.

But it is in the internal administration of the school that there is the greatest departure from the Paris traditions. For the last hundred years, at least—that is to say, ever since Napoleon proclaimed the *carrière ouverte aux talents*—the system of competition for place has pervaded French institutions. The École des Beaux-Arts is an admirable and efficient organism of tests and examinations, mentions, medals, and all sorts of honours, calculated to stimulate its students to their utmost endeavour and to add the spur of emulation and personal distinction. For all this machinery the promise of Government support to the man who wins in the race furnishes the motive power. The whole is so complete in every part, so smooth and effective in its workings, and the result so sure, that one is disposed to think that like effects can be produced only by like causes, and that the best anyone could do would be to profit by so brilliant an example and follow it point by point. But in this country such a course is impossible. The mainspring of Government patronage is wanting; and, though one might fancy that, even so, the forces of rivalry and personal ambition would suffice to accomplish the same ends, it is doubtful whether even in Paris, where all the habits and traditions of society are in harmony with the system, the medals and mentions, even the *Prix de Rome* itself, would prove to have any lasting validity without it. It is not the piston or the driving-wheel that moves the train, not even the boiler behind them, but the coal hidden under the boiler. In this country, where the whole system of examinations and competitions and prizes is unfamiliar, uncongenial to our habits, and in general distasteful, there would seem to be little chance of making it effectual, even if what experience of it we have had did not discourage the expectation. And, in fact, the present tendency seems to be the other way. The prizes for scholarship established by a previous generation have not worked as was expected; and the establishment of new prizes for schoolwork is, in this locality at least, officially discouraged. The traditions and habits, as well as the underlying forces, that render this system so successful abroad seem to be lacking here. Even in a *jardin d'acclimatation* it is not the exotics but the native varieties, sprung from the soil, that best flourish and grow. Different people have different ways, and in this country the ultimate energies that make the world go round reside not in the Government but in private persons, and we rely upon personal interest to carry to an end what personal initiative has begun.

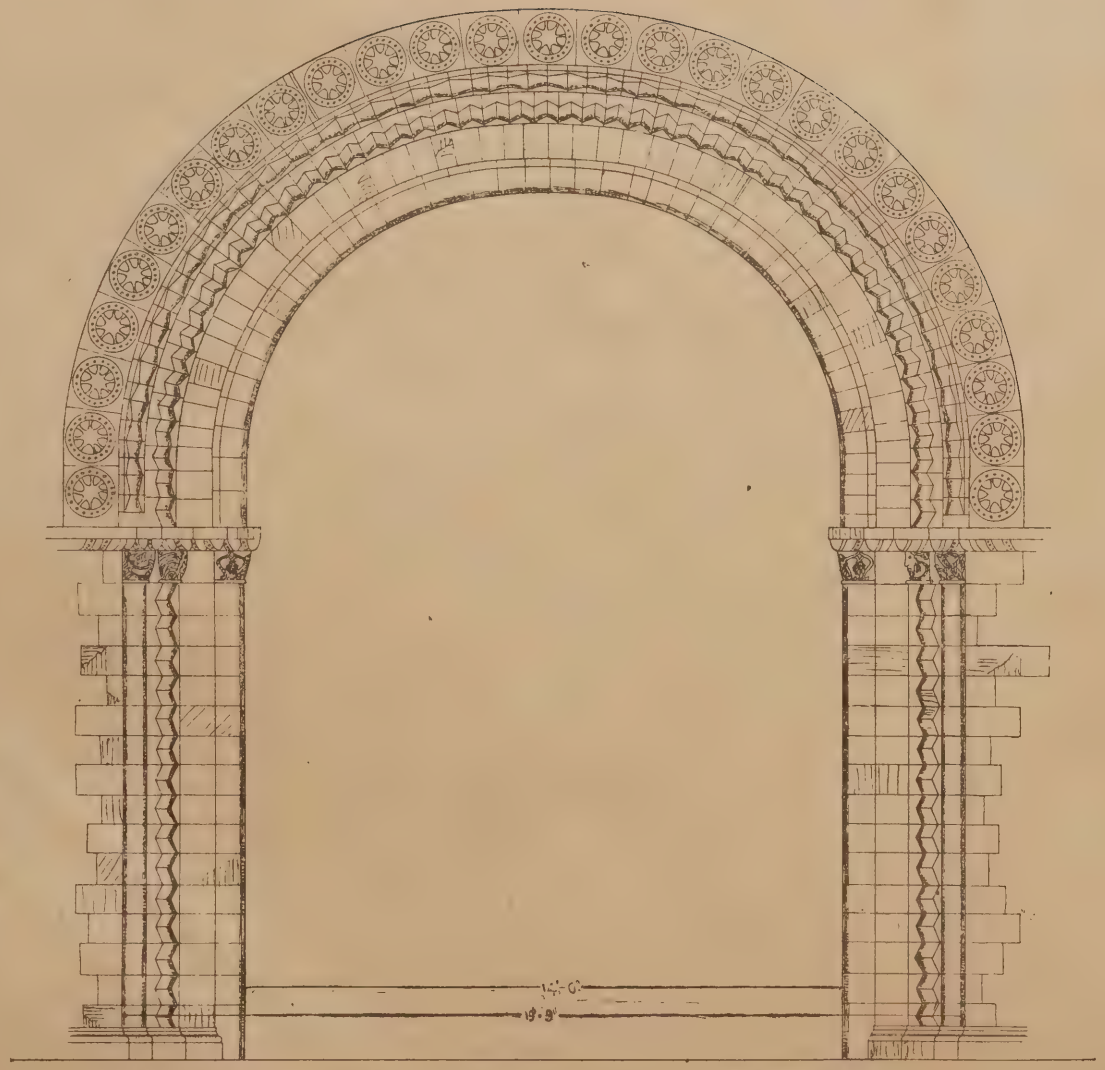
Moreover, the conditions which in Paris reduce to a minimum the disadvantages of the system are also lacking in this country, and are not likely to be supplied. Gossip and scandal, charges of partisanship and undue influence among the judges, and of intrigue and bad faith among the competitors are, indeed, not unknown even in Paris. But these things need not be taken too seriously, for they are inseparable from the system. But the more offensive and obnoxious elements of personal jealousy and hostility are there largely eliminated by the fact that the rivalry and emulation in the School of Fine Arts is not between persons so much as between different *ateliers*. This raises the whole tone. For private quarrel is substituted, as it were, a state of public war, with the dignity and responsibility and the freedom from personal feeling that common sacrifices in a common cause naturally involve. Between members of the same class in the same school there is no such protection from the baser passions.

Besides, after all, we must believe that even in France—in France, indeed, more than anywhere—the real motive power in all their splendid achievements is to be found, not in any external conditions or inducements whatever, neither in the hope of Government employment, nor in academic honours. The somewhat second-rate men who throng the Government schools, in the hope of escaping military service, may very likely need these pricks and goads to keep them up to their work. But with the best of the Frenchmen, as with the large and brilliant company of American students who join their ranks, the motive forces, as we must believe, are to be found within. It is the importance and interest of the subject and their own enthusiasm for it that animate the men at the top of the school and crown its work. So in England. The English may be a nation of shopkeepers, as Sam Adams called them, and the extraordinary prevalence of money prizes for every species of scholastic endeavour may seem to give evidence of a most mercenary spirit; but this is a mere national habit, a curious tradition; and one must believe that English culture and scholarship would be the same if all the exhibitions and foundations were abolished, the English people being what they are. It is not these that achieve the result, but intellectual character and elevation of mind.

For our own part, at any rate, these are the lofty foundations on which we prefer to build; and so far we have found little occasion for serious misgivings and little inducement to change our policy.

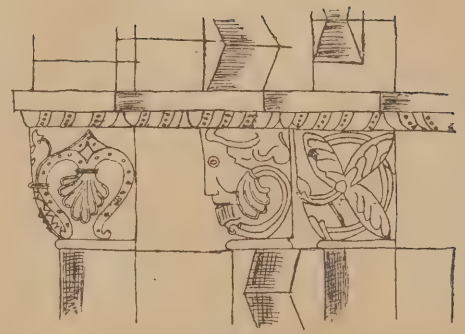
* Extract from a paper by Professor W. R. Ware on the School of Architecture in Columbia University, U.S.A.

EDINBURGH'S HOUSING SCHEMES.



THE Lord Provost, in his recent opening address to the Edinburgh Town Council, indicated by his remarks that he considered the housing of the working classes would be one of the subjects required to be faced during his term of office. Not for many years has there been in the civic chair a Lord Provost who is better equipped for carrying through such an undertaking, for his Lordship's practical experience as a builder all his life has been so varied and so extensive that he should be able to ensure success. The first housing scheme at Edinburgh was carried out in High-School Yards, where two tenements were erected, four storeys in height towards the High School Yards, and five storeys towards the Cowgate. In these two tenements there are fifty-six separate houses and eight shops. The shops are only partly occupied, this locality not being suitable for shops. The cost was £10,545, excluding ground at £1 a yard. The second scheme was that at Tynecastle, where two blocks containing sixty-four separate houses of varying dimensions were erected. The total outlay was £9,886, including ground at 5s a yard. The third scheme was in "ground area D," at the back of the Police Chambers in the Cowgate. The cost was £17,000 for 105 houses, including caretaker's house. The building of eighty-one houses is at present going on in Allan Street, the estimated cost being £8 400. At the foot of the West Port active operations are proceeding for the erection of 61 single-roomed houses. The estimated cost is £6,100. Another scheme is in hand which contemplates the erection of two three-storey blocks in Potterrow, consisting of 37 houses, and estimated at £4,740.

The clearances effected under Sir James Russell's scheme have cost £99,296, including the expenses of obtaining powers. The localities where these operations have been carried out are Campbell's Close, Jackson's Close, Old Assembly Close, Baxter's Close, Potterrow, Riddle's Court, and Candlemaker Row. In some cases private individuals or a company have effected the clearances, so that the Corporation was spared from paying the total cost of the improvements. Besides Sir James Russell's scheme, which was promulgated during his Lord Provostship in 1893 and was the first scheme of its kind, there was another arranged in 1898, which included Stockbridge and Angus Street and Saunders Street and Pipe Street areas, Portobello. This year a third scheme included Greenside and Paul Street. The original clearance scheme embraced an area of 6½ acres. The rents of all the Corporation houses range from 2s. 7d. to 4s. 3d. for single and double-roomed houses, including taxes. It is said that there is a great demand by tenants for these houses. With regard to the financial aspect of the housing scheme, it is held that the cost of the houses will not come on the rates. It has been arranged to pay off the cost in thirty years.



At Christ Church, High Wycombe, a new memorial east window has been unveiled.

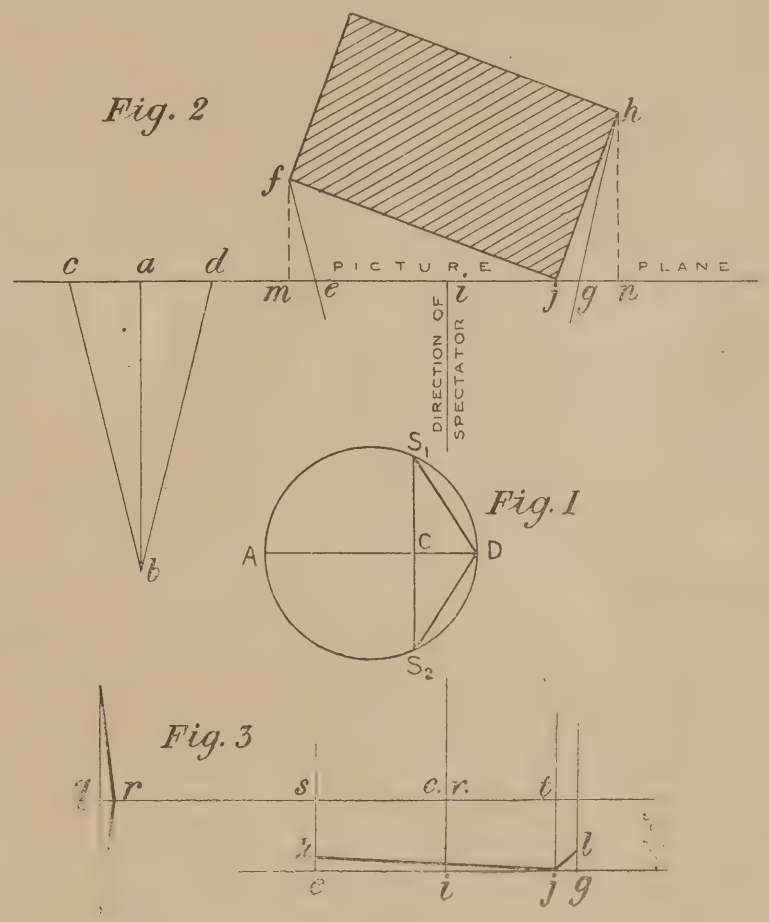
Use of Centrolinead for Perspectives.

To the Editor of THE BUILDERS' JOURNAL.

SIDMOUTH.

SIR,—The reply published on page 281 of your issue for November 7th with regard to the the centrolinead is not, in my opinion, satisfactory. In the first place the point of sight is *not* on the side of the long vanishing point, which is obvious from your own diagram; secondly, there is not the least necessity for decimals; and, thirdly, the assumption that 8in. on either side of the horizontal line for the pins will suit any perspective is absurd. I am indebted to you for the information that Peter Nicholson invented the centrolinead, but should very much like to know how *he* set it—he surely did not make a thing he could not use; Mr. Bryan's formula reminds one of Batty Langley's description of how projections, &c., were determined in the various Classic orders. My experience may be limited, but it goes to show that not one man in fifty can *really* set a centrolinead: he can worry till he gets an approximate result in three minutes or three hours, but what he wants to know is, how he can set the centrolinead right first time with his set square or other handy instrument; and I should very much like to see if any of your correspondents can tell him.

Yours truly,
R. W. SAMPSON.



To the Editor of THE BUILDERS' JOURNAL.

SIR,—In reply to the above letter, which you kindly forwarded me, I may say that I did not test the description given, before quoting, as upon the surface there appeared no reason to doubt it. I have however now done so, and hope the result will be useful to your readers. Mr. Bryan's formula is based upon the well-known geometrical problem shown in Fig. 1, where A is the vanishing point, and A C : C S :: C S : C D, whence $C D = \frac{(CS)^2}{AC}$. There is an omission of a few words in his description. The complete sentence should read:—Lay the short arms of the centrolinead *exactly* along the short lines, D S′, D S″ (see issue for November 7th), and the long arm along the line A B. There is also an assumption that the distance of the vanishing-point from the point of sight (or more correctly the centre of vision) is known, otherwise the description appears to be correct. He does not say the point of sight is on the side of the long vanishing point, or any such nonsense.

I have Peter Nicholson's original work, entitled "A Treatise on Practical Perspective without the Use of Vanishing Points, being an Application of the Centrolinead to Perspective, &c.," 1815 (Barfield 10s. 6d.), which I shall be happy to lend your correspondent, but I do not quote from it as I have tested his methods and found them approximate only. My own method, as resulting from the investigation, is as follows. Let Fig 2 represent plan of building and position of picture plane. In any convenient position at side of plan set off $a\,b$ perpendicular to $c\,d$, let $c\,a = a\,d$, and $a\,b$ be as much longer than $c\,d$ as the distance of spectator is required to exceed the width of picture, say 2 to 1; then $a\,b = 2\,c\,d$. Join $c\,b$, $d\,b$, and draw lines $e\,f$ and $g\,h$ parallel to $b\,c$ and $b\,d$, respectively. Bisect $e\,g$ in point i and draw a perpendicular representing direction of spectator, whose distance from picture plane will be twice $e\,g$. Upon the perspective sheet, Fig. 3, draw a horizontal line representing the base of the picture plane, and 5 ft above it a line representing the horizon or height of the spectator's eye, with a vertical cutting the horizon at the centre of vision C.V. Transfer the distances $e\,i\,j\,g$ from plan to Fig. 3 and draw verticals. The heights $e\,k$ and $g\,l$ are found as follows:—Let $f\,m$ and $h\,n$ in Fig 2 be the perpendicular distances from picture plane, then $e\,k = 5 \times \frac{f\,m}{2\,(e\,g)+(f\,m)}$ and $g\,l = 5 \times \frac{h\,n}{2\,(e\,g)+(h\,n)}$. Join points $j\,k$ and $j\,l$, giving the perspective view of base of main walls. Set up $o\,p$ in any convenient position for the centrolinead pins, equidistant above and below horizon line, and intersecting it in q. The distance may be about 6 in. above and below horizon, but must be called so many feet, using the same scale as the remainder of the drawing. Then as $e\,k : j\,e :: k\,s$ to the distance of the vanishing point on that side from s. Call this distance x, then $x = \frac{j\,e \times k\,s}{e\,k}$. The same principle applied to the other side will give the points for vanishing in the other direction. Then $x - q\,s$ will be equivalent to A C of Fig. 1; therefore $(x - q\,s) : q\,o :: q\,o : q\,r$, or $\frac{(q\,o)^2}{x - q\,s} = q\,r$. Join $r\,p$ and $r\,o$, then the short arms of centrolinead must coincide with $r\,p$, $r\,o$, and the long arm with $r\,s$.

Anyone with a knowledge of architects' perspective can now complete the drawing without difficulty. The centrolinead may be used for obtaining the visual rays from windows, &c., in plan, by adopting the principle detailed above, or they may be marked off with a trammel. In the absence of a centrolinead a piece of Bristol board or stout drawing-paper may be cut out of the solid to give the direction of the three arms, and used against two drawing-pins.—Yours truly,

HENRY ADAMS.

A Question of Light.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I have read with interest the enquiry and answer on page 374 of your issue for December 12th with reference to "A Question of Light," and I should like with your permission to make some comments on both the question and the answer.

In the first place, I would advise your querist "J. S. B." to consult a good conveyancing lawyer on the subject, placing him necessarily in possession of all the facts of the case, and also placing the titles of the property in the lawyer's hands for perusal. These titles ought to show at once whether the church has any right of light over the "private lane." This right of light can only *in Scotland* be acquired by a "written grant"; ordinarily, the case of a building on a feu, such as (apparently) this church is, this "written grant" would be contained in the original feu-charter or feu-disposition. But the written grant might also be obtained subsequently, and this appears to be the case here, as the arrangement with B appears to have been effected some time subsequent to the building of the church. One can hardly suppose that such an arrangement could have been made and carried out without a "writing" on the subject; if this "writing" bears that B, upon consideration of the payment of £5 5s. per annum, guarantees not to build upon the private lane, then the church trustees are acting adversely to their own interests in trying to break the agreement because of outside circumstances—namely the erection of the school building—with which they have nothing whatever to do. On the other hand, if there is no written grant of light to the church, either at first hand under the original title or under a writing relative to the annual payment—the payment being made only upon a mutual understanding—then B can build upon his lane at any time, and more especially since the trustees have broken their agreement. The erection of the school building is no protection *unless* the school has acquired a written grant of light over B's lane—not over a part of it merely, but over the whole of it.

The difference between Scottish and English law in regard to right of light is an essential one. We have no "ancient lights" in Scotland, a matter for which I, for one, am duly thankful. As I have indicated in the earlier part of this letter, a right of light over another owner's property can only be acquired under a written grant in Scotland, and not merely by the lapse of time; therefore the reply of "G. H. B.", so far as its last sentence is concerned, where he states the law as regards ancient lights as it holds in England, is misleading and erroneous as regards Scotland. The principle underlying the Scottish law on the subject is this:—The owner of the "*solum*" of a piece of ground can do what he likes with it, including building on the whole area of it, *unless* there be some written obligation in his titles to prevent him doing so. Therefore, unless he is expressly obliged by his titles, or comes unde

an agreement to provide light over his ground to his next neighbour, his neighbour cannot claim that right of light. Of course it may happen that where two owners derive from a common author the right may be created in the titles of the owner whose property claims the right. This, of course, needs no explanation.—Yours faithfully,

JAMES KENNEDY HUNTER.

Gas Geysers.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, N.W.

SIR,—Our attention has been drawn to newspaper reports of an inquest held at Hammersmith on December 14th on the body of a boy who died from carbon-oxide poisoning after bathing in a room supplied with hot water by a gas geyser. The reports do not state the one important point, namely, that the geyser was *not* supplied with a ventilating pipe. It is stated that the apartment measured 256 cub. ft., and that the doctor said that the space should not have been less than 700 cub. ft. In the public interest it is of immense importance that the matter should be clearly understood. Of course if a room has sufficient cubical contents the poisonous fumes from the gas would have proportionately less effect, though, with all respect to the doctor, we do not think in a room even of 700 cub. ft. dimensions it would be very safe to use such a quantity of gas without a ventilating pipe; but the fact is that the majority of bathrooms are, and must always be, of small dimensions. It is therefore absolutely necessary to insist that no geyser shall be fixed in a bathroom without a separate pipe to convey the fumes outside the apartment. It is not sufficient to insist that the bathroom must be ventilated, because all ordinary ventilators can be easily closed, and any careless bather feeling a draught would take upon himself to close them while bathing.

We may add that the question is not one of the difference between a luminous flame and a bunsen burner. If there is any difference in the mischievous power of one flame over the other, it is so little that it does not affect the question. Every gas flame, as is well known, throws off injurious products. The very usefulness of a geyser depends on the fact that it consumes a large quantity of gas in a very short time; consequently there must be a large escape of poisonous fumes. We are quite sure that there is no other way of using these now indispensable machines safely except by fixing a separate fume-pipe to *every* geyser.

Yours truly,

EWART & SON.

"Render unto Cæsar."

To the Editor of THE BUILDERS' JOURNAL.

LONDON, N.

SIR,—Will you allow me space to add a few words to this interesting discussion. "J. B." in his reply to "I. Y.'s" letter says that he champions the architects who *do not* draw, not the architects who *cannot*. Surely, sir, those who cannot may under certain circumstances claim our sympathy, but those who can, but will not draw, merit our contempt. "J. B." further says that success has robbed the architects he champions of their leisure and has forced them to become "brain-workers alone." The inference is obvious: drawing with them is the brainless occupation of idle hours. It reminds me of the story of the old lady who thought she would make her son an artist because he was weak in the head. Drawing is but the simple "writing down" of an impression, and there is little difficulty in tracing or writing down what the mind sees clearly. Yet "J. B." would have it that this power of perception, this manner of seeing things which stamps the individuality of the artist, is a thing to be bartered like a garment. There are many of us who would willingly pay the price! It seems strange that this power of thought transference should be claimed among artists by architects alone. Does a painter or a sculptor pose as the author of work he does not execute? No, "J. B.," your architects are, I am afraid, the quacks of art, hard-headed resolute hypocrites often enough, against whom I dare to draw a shaft, be they ever so successful.—Yours truly,

M. C.

Architectural Appointments in Egypt.

To the Editor of THE BUILDERS' JOURNAL.

KIRKCALDY.

SIR,—In his published annual report Sir W. Garstin says that young architects are required by the Public Works Department of Egypt, but that no suitable applicants come forward. Would you kindly tell me what are the prospects of the appointment, and why there are no applications? Kindly also state where to apply for information?

Perhaps by putting this in your correspondence column you might get the opinion of someone who has been through the mill. I noticed a correspondent wrote in your issue for May 16th last, under the *nom de plume* of "Caught," on the disadvantages of the Admiralty Works Department, the Royal Engineer Department, the English Office of Works, and the Irish Board of Works. Would this Egyptian appointment be similarly unsatisfactory, and might this not be the reason why no applicants come forward?

Yours truly,

REI.

Duddington Church, Northamptonshire.

To the Editor of THE BUILDERS' JOURNAL.

NEW BARNET.

SIR,—Can any of your readers explain why in the south porch of this church there should be a two-light window on the east side and a single one on the west side, there being nothing peculiar in the surroundings to call for this difference? The two-light window is all of one stone, comprising the four sides and the dividing mullion. The two arches of the window are round.—Yours truly,

ARTHUR J. WATERFIELD.

Builders' Notes.

Scarborough Master Builders' Association held its annual dinner at the Albermarle Hotel recently, Mr. A. W. Sinclair (president) occupying the chair.

London County Council.—At last week's meeting of the Council Mr. Cornwall, in moving the adoption of the Site Values (London) Rating Bill, recommended by the Parliamentary and Local Government and Taxation Committees, said that the estimated site value of London was £16 000,000. The Bill proposed to levy a rate of 2s. in the pound upon persons enjoying incomes from site values. After discussion the recommendation was agreed to. The Public Health Committee recommended: (1) That the Local Government Board should be informed that, in the opinion of the Council, no useful object would be served by exempting lunatic asylums in London from the Council's proposed by-laws as to drainage; and (2) that it should be pointed out to the Board that the drains of those buildings would, even if exempted from the by-laws, still remain subject to the control of the sanitary authorities, under the Metropolis Management Act of 1855 This was agreed to. Considerable discussion arose upon a recommendation of the Housing Committee that £12,500 should be expended on purchasing 1¼ acres in Wedmore Street, Holloway Road, Islington, upon which it was proposed to erect workmen's dwellings, but eventually the report was adopted. The appointment of Dr. A. B. W. Kennedy as electrical engineer for the reconstruction for electrical traction of certain tramways was confirmed. It was also resolved to appoint a second electrical engineer at a salary of £1,000 a year. The plans of the new Gaiety Theatre (Ernest Runtz, architect) to be erected at the junction of the Strand with the west spur of the proposed new road from Holborn to the Strand, to accommodate 1,259 persons, were adopted. The Asylums Committee recommended an expenditure of £89,000 in establishing a working colony for epileptics on the Horton estate. The Council adjourned until Jan. 22nd.

Quarry Notes.

The Northern Quarries Company have acquired some property known as Mossdale, near Silverdale, Lancashire, formerly in the possession of the curate of Silverdale.

Messrs. John McAdam and Sons, quarry-owners, Aberdeen, have purchased the estate of Camming's Park, which is situated about two miles from the city, and in close proximity to one of the firm's quarries. There is plenty of granite on the estate, and one large quarry hole where Messrs. Fordyce and Co., the old-established firm of builders, carried on quarrying operations for a number of years.

Messrs. A. and F. Manuelle have decided to re-open the upper quarry at the Dancing Cairns, which has been closed for many years, and preparations are now in progress for the erection of the necessary plant. The quarry is to be equipped with the most advanced appliances for carrying on the work expeditiously. The quarry is one of the old workings in Aberdeenshire which have produced a considerable quantity of excellent granite, and it is expected that when the quarry is in full working order, stones of fine, uniform colour, suitable for monumental building and paving purposes, will be obtained. Mr. Archibald Murray has been appointed to the management.

An Irish Monument.—A monument has recently been erected to the memory of the late Mr. John Doherty, Falls Road, Belfast, over his grave in Milltown Cemetery. The monument was designed by Mr. Thomas Magee and the work was carried out by Mr. M'Auley (O'Neil & Co.), Divis Street, Belfast. It consists of a Roman cross, cap, pedestal and sub-base of Aberdeen black granite, all these parts being polished, front and back, and standing on a bottom base of Newry granite fine-axed. The grave is enclosed by a bevelled plinth, also of Newry granite fine-axed, and having the bevelled surface polished. The monument stands 10ft. high, the cross 4ft. 10in., resting on a pedestal and base 5ft. 2in.

Italian Marble in 1899.—Reports just issued by the Italian Government show that a great increase in the production of Italian marble took place last year. The total production in 1899 of the quarries in the Carrara district was 279,112 tons, as against 245,213 tons produced last year. There is no corresponding increase, however, in the number of wokmen employed, the output of each quarryman rising from 38 92 tons in 1898 to 44 31 tons in 1899, and, what is still more extraordinary, the cost of production was reduced from 16·76 lire per ton to 14 73 lire per ton. The number of quarries open during the two years are thus classified:—

	1898.	1899.
Active	471	528
Inactive	793	736

The total quantity of marble exported was 235,680 tons, against 205,168 in 1898. The following are the countries importing quantities of 10,000 tons and over in the years 1898 and 1899:—

	1898. Tons.	1899. Tons.
France	24,087	27,691
Great Britain	40,089	37,757
Germany	15,280	21 259
Belgium	6,672	10 935
United States	39,859	41,522

The United States once more heads the list, and Great Britain has fallen to a second place. The trade of Germany is very largely increasing, as is also that of Belgium. The home trade in Italy appears to have been prosperous, as it is responsible for the consumption of 48,783 tons of marble, as against 41,909 in 1898. Another feature in the returns is the large increase in the amount of manufactured work exported last year; 22,912 tons is thus described, as against 16,741 tons in 1898. The three classes of marble exported in the two years is thus tabulated:—

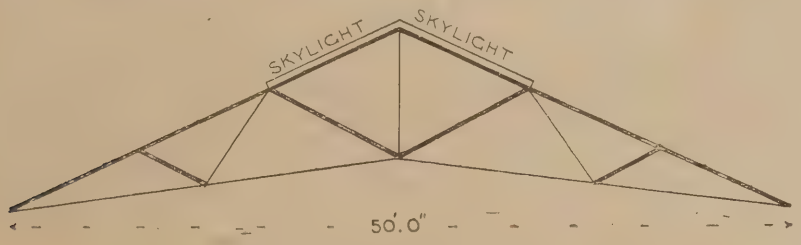
	1898. Tons.	1899. Tons.
Blocks	93,126	88,422
Sawn	61,392	65,553
Worked	16,741	22,912

It will be seen from this table how largely the increase of manufactured goods is responsible for the total increase.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Legal Position of the Architect.



NORTHAMPTON.—ANXIOUS writes: "In an article on 'The Legal Position of the Architect' (see THE BUILDERS' JOURNAL for November 14th last) Mr. Macassey refers to a book published by him. Where is this obtainable, and what is the cost?"

"The Law relating to Civil Engineers, Architects, and Contractors," by Luke Livingston Macassey and James Andrew Strahan (2nd edition, 1897), is published by Stevens & Sons, Ltd., 119 and 120 Chancery Lane, W.C., price 10s. nett. G. H. B.

Roof for Hall.

EDINBURGH.—SCOT writes: "Which is the simplest and least expensive method of roofing a hall 70ft. long and 50ft. wide, lighted entirely from the roof?"

The construction of roof will depend very much upon the amount of light required, and this cannot be determined without knowing the purpose for which it will be used; also, whether a curved roof would be admissible, as this is generally cheaper, though decidedly more difficult to harmonise with surroundings.

ROOF FOR HALL.

Probably the best arrangement would be a steel truss with skylight, as shown in the accompanying sketch. This form of truss lends itself readily to the formation of hipped ends.

HENRY ADAMS.

Powers of Sanitary Authorities.

W. E. writes: "Some time ago the sanitary authorities ordered the closing of a dwelling-house. There is dampness in one wall of the house due to the proximity of a defective sewer, the property it is believed of several owners. The owner of the house has no share in or control over the sewer. The local authorities say that the sewer is private property. They also refuse to take any steps to compel the owner or owners to abate the nuisance caused by it. They have been formally asked to do so, but evade the real question by stating that the house was closed because it was a nuisance, and that when closed the nuisance ceased. Can they do this; are they not obliged to give a reason? Would the owner of the house be safe in taking legal proceedings against the owner of the land on which the sewer lies?"

In the absence of any common agreement, the question as to whether the adjacent drain is legally a "drain" or a "sewer" is dependent on the provisions of the local by-laws, and of the particular Acts of Parliament under which they are enforced (see page 173 of THE BUILDERS' JOURNAL for October 3rd last). If you are prepared to incur expense, perhaps it might be advisable to take legal proceedings against the sanitary authority, so as to force the matter to a distinct issue. In any case, your best course is to consult some experienced local solicitor conversant with the district and its by-laws, and who, from a general knowledge of the condemned building and its surroundings, would be able to advise you on the subject. It is probable that there may be other contributory causes which have led to the action of the sanitary authority. T. E. C.

Modern Renaissance Buildings at Sunderland.

SUNDERLAND.—ENQUIRER writes: "Kindly name a few modern Renaissance buildings in the neighbourhood of Sunderland which are worth measuring."

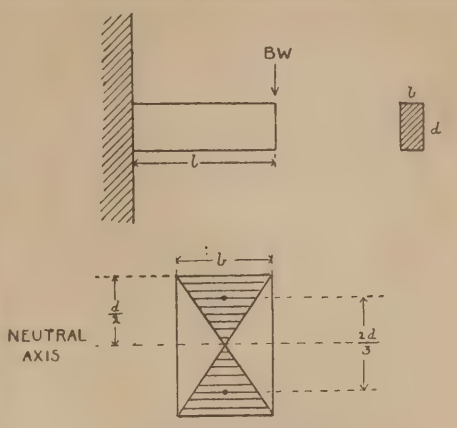
In High Street, Sunderland, the façade of the upper storeys of the "Cobden Exchange" and also of Stanton's boot shop, near Central Station, Newcastle-on-Tyne, the façade of the Tyne Commissioner's offices—all modern examples.

Models of Plaster Enrichments.

BATH.—J. A. writes: "Where can I purchase models of plaster enrichments and cement dressings? If the designs are not suitable, shall I require to have the work modelled?"

Models of plaster enrichments and cement dressings can be purchased from W. Millar, No 1 Arch, Battersea Park Station, London. For new designs model-making, and modelling, according to the design, are requisite. W. M.

Strength of Foundations.



LONDON, W.C.—F. F. writes: "The accompanying section (not reproduced) shows a small back addition, upon which it is proposed to raise another storey 11ft. high. The existing old back addition of the one storey (ground) is built over very old vaults of two 4½in. brick ringed arches of an elliptical section, the depth between the foundations of the back addition and the crown of the arch of the vaults being about 4ft. Would it be safe to raise upon the 9in. walls of the back addition the additional 11ft. storey, without building piers at the angles and taking foundations through arch of vaults to a firm bottom, and supporting the walls of the second storey on rolled steel joists? Would the proposed extra weight on the existing back addition tend to crush in the elliptical arch of vault under?"

There is some risk in this case, and it is one in which a specialist should be consulted. He would probably want to examine the *locus in quo*. HENRY ADAMS.

Modulus of Rupture.

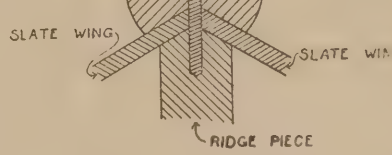
LONDON.—J. L. W. writes: "On page 212 of your issue for October 17th last 'R. W. C.', in explaining why the strength of a beam varied as its breadth whilst it varies as the square of its depth, made use of the following formula: Bending moment = $T\frac{bd^2}{6}$, where T = modulus of rupture per sq. in. I should be much obliged if you could inform me why $T\frac{bd^2}{6}$ is upon 6; and also the meaning of modulus of rupture per sq. in."

The "modulus of rupture" of a material is its ultimate resistance per square inch as averaged upon the assumption that it is equally strong to resist tension and compression, the neutral axis of a rectangular beam being thus brought to the centre. For fir of ordinary quality this modulus is 60 cwts. (3 tons), while for oak it is 78 cwts. (nearly 4 tons). The easiest way of explaining how it is that the bending moment of a rectangular beam equals *one-sixth* of $T\,bd^2$ is to work out a simple example. At the moment of fracture of a

MODULUS OF RUPTURE.

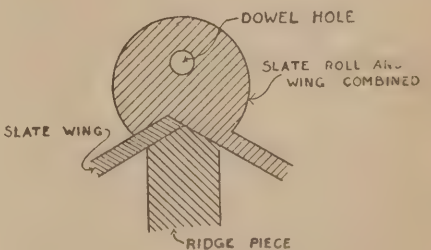
rectangular cantilever carrying an end load B W (see accompanying sketch), the bending moment is B W × *l*. If the modulus be taken in cwts. per sq. in., it is necessary to take B W in cwts. and *l* in inches, in order to preserve identity of units. Now, when the cantilever is upon the point of breaking, the outer fibres of the section (top and bottom) are about to give way, while the centre fibres (along the neutral axis) are neither stretched nor compressed. The effect is as if the shaded portions of the section were stressed to their utmost capacity and the remainder cut away. These shaded portions may be considered as the two flanges of a flanged structure, with their resistances collected at their centres of gravity, and the effective depth of the structure represented by $\frac{2d}{3}$, which is the distance between these centres. The resistance of either of the triangular flanges is represented by its area $\left(\frac{bd}{4}\right)$ multiplied by the modulus of rupture T, and the stress moment therefore is $T \times \frac{bd}{4} \times \frac{2d}{3}$.

This equates with the bending moment B W × *l*.



$$\text{Thus } B\,W \times l = T \times \frac{bd}{4} \times \frac{2d}{3}$$
$$= 2\,T\frac{bd^2}{12}$$
$$= T\frac{bd^2}{6}.$$

R. W. C.

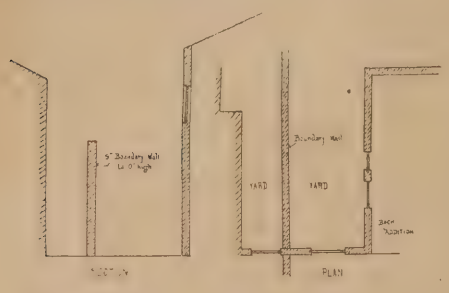


Ridges.

MANCHESTER HOME WORK writes: "What is a 'Thomas Ridge,' also a 'Williams Ridge'?"

The accompanying sketches will no doubt supply queriest with the particulars he desires.

"THOMAS" RIDGE



"WILLIAMS" RIDGE

Boundary Wall and Right of Light.

LONDON, E.—C. S. writes: "I am building new shop premises. The next-door landlord objects to the back addition on the ground that it encroaches on his ancient lights; I have altered the plans so as to come within 45deg., but he now says that I am creating new lights overlooking his premises, and objects to the windows being put in this position. Can he legally do so? The accompanying sketches illustrate what I mean."

The adjoining owner cannot prevent the

BOUNDARY WALL AND RIGHT OF LIGHT.

building owner from forming windows which may overlook the adjoining owner's premises, but he can build a wall upon his own ground which will obstruct the view from those windows over his premises, and so prevent the building owner from acquiring rights of light by twenty years' user. He may build such wall at any time within nineteen years, but in your case he is not likely to do so, as it would obstruct his own light. G. H. B.

Right of Light.

NORTHAMPTON.—ANXIOUS writes: "(1) A owns a covered yard which is used as a store for timber, &c. B's property adjoins, and between the two is a low stone wall (B's property). On top of this A erects wooden uprights and nails to them boards which reach to within about 4ft. of the underside of a glazed roof over the yard. The remaining space is left open, and has probably been in this condition for more than twenty years. Does A acquire a right of light through this space? It is not a window nor an opening for a window. The boards were simply erected to prevent anyone climbing over wall from B's property into A's. (2) In reports of various right of light cases one sees letters such as 7 Q.B.D., 529. These refer to former cases. In what book are they to be found?"

(1) If A's structure is only a timber store it does not appear that A can have acquired a right of light over B's property, because A's structure does not seem to be a dwelling-house, workshop, or other building within the meaning of the Prescription Act (see *Harris* v. *De Pinna*, 33 Ch.D., 238). (2) Reports of cases tried in the superior courts are to be found in the Law Reports published for the Council of Law Reporting by W. Clowes and Sons, Ltd., 27 Fleet Street, E.C. There are numerous volumes of these Reports, and the reference to 7 Q.B.D., 529 means the 7th volume of reports of cases in the Queen's Bench Division, page 529. G. H. B.

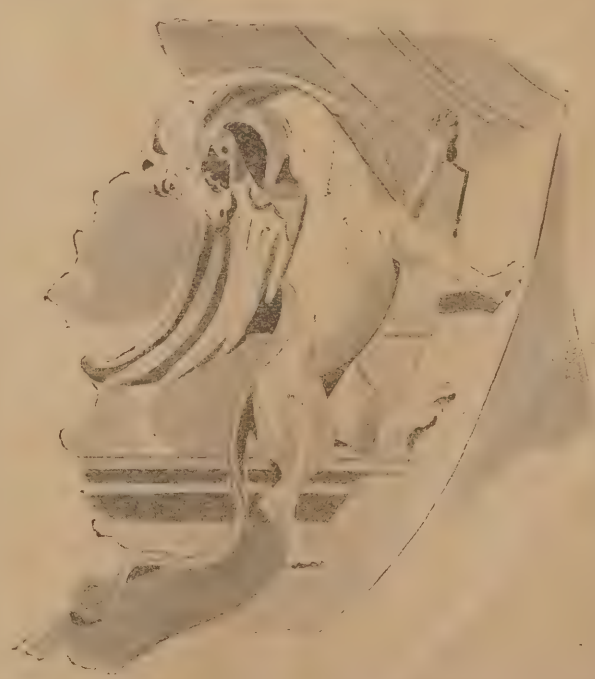
Book on Perspective.

BOLTON.—H. S. writes: "Kindly recommend a good advanced perspective text-book."

Ferguson's "Architectural Perspective," 3s. Published by Mr. B. T. Batsford, 94 High Holborn, W.C.

"Sweating" of Plastered Walls.

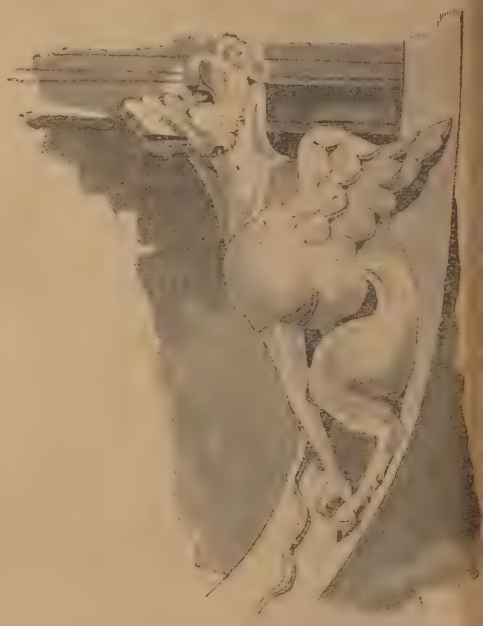
WOLVERHAMPTON.—SUDOR writes: "What is the cause of the sweating of painted plastered walls, not necessarily new work nor outside walls?"



Without fuller particulars of the materials used for plastering, age, and position of walls, it is difficult to state accurately the cause of sweating, but, doubtless, it is due to condensation. Thorough ventilation is a cure for condensation. W. MILLAR.

Bricks and Mortar.

APHORISM FOR THE WEEK.



Art is not the bread indeed, but it is the wine of life.—JEAN PAUL.

Our Plates. LLANDAFF CATHEDRAL has no central feature, such as a tower or transepts, and a characteristic which is immediately noticed is the long—and except at one point—unbroken plan, comprising the nave, choir and presbytery under one roof. The one break is the chapter-house, which projects on the south side. The addition of buttresses in the recent restoration helps to somewhat relieve the plainness and flatness of this treatment. The foundation of the See is said to be the oldest now existing in Great Britain that still remains on its original site; but no portion of an earlier building than that founded by Bishop Urban in 1120 now remains, the chief remaining feature of which is the large Early Norman arch behind the high altar, which is one of the most effective features of the interior. This arch was doubtless the chancel arch of Bishop Urban's church. The Norman doorway on the north side, and that on the south side, are attributed to Bishop Henry, of Abergavenny, who held the See in the twelfth century. The chief beauty and the most attractive portion of the cathedral is the west front, which was built at a time when the Early English style was at its best. The interior design, in detail, arrangement and proportion is very fine, and it gains a great deal in dignity by the difference in height between the level of the nave floor and the ground outside, there being a fall of several feet at this point. The similarity of the treatment of this front with that of Ste. Remi at Rheims is said to be very striking, the proportion and grouping of the windows being almost identical, suggesting that the architect was the same in each case. From 1703 until about thirty-seven years ago the cathedral was unused, left to the mercy of the weather and in a pitiable state of decay; the walls of the nave were ivy-grown, and grass covered the nave floor, whilst the aisles themselves were roofless. A movement for the complete restoration however, was commenced by Deans Knight and Conybeare in 1843, including the rebuilding of the presbytery, choir and nave, and the building was put in its present condition. The cathedral is 250ft. long and 64ft. 3in. wide inside. The nave consists of six bays, the choir and presbytery of two bays each, and the Lady Chapel at the east end of five bays. Our illustrations are from measured drawings by Mr. R. Reginald Morton.

CARVING ON CHOIR STALLS, AMIENS CATHEDRAL. DRAWN BY ARNOLD MITCHELL.

Choir Stalls, Amiens Cathedral. MR. ARNOLD MITCHELL'S drawings of choir stall details in the great cathedral of Amiens, illustrated on this and the next page, show the beauty of the old Gothic work and exemplify the love of variety which saturated the whole spirit of the workman. Amiens Cathedral belongs to the great building period of France, namely, the thirteenth century, the century which witnessed the rise of those other great cathedrals of Rheims, Chartres, Coutances, Beauvais, Notre Dame (Paris), and Bourges. Amiens is the most characteristic of the French cathedrals, as Salisbury is of the English ones, and the carving to be seen there is of the very finest character.

CARVING ON CHOIR STALLS, AMIENS CATHEDRAL. DRAWN BY ARNOLD MITCHELL.

Ruskin's Monument. Mr. Miles, of Ulverston, is at present carving the monument to be placed over Ruskin's grave at Coniston. It will be a tall cross of the type lately revived from ancient models of the age before the Norman Conquest. Some of these were the "wheel" crosses, which have been most in favour, and are often seen in churchyards. An earlier form of cross, and one more purely English, was the three-armed type, like that at Irton, and the still more famous Ruthwell Cross. This Early English model has been freely adapted, not slavishly reproduced. The cross is of the hard green stone of the neighbourhood, supplied from the quarries of Tilberthwaite. The base is cut into the three Calvary steps, as they are called, and on the side facing the grave and looking east, at the bottom will be a figure with a lyre, representing Mr. Ruskin's earliest works, poems, and the poetry of architecture. Above this, in a panel of interlaced work, is his name and the dates 1819–1900, the only lettering thought necessary. All the rest of the story is told in pictures. Over the name is the figure of an artist sketching; above are the Lion of St. Mark (for his "Stones of Venice") and the candlestick of the Tabernacle (for "Seven Lamps"). The south side is filled with a scroll of his favourite wild-rose in bud, blossom and fruit; and on the boughs three of the creatures he wrote about with affection — the squirrel,

the robin and the kingfisher. On the west side is the parable of the workmen receiving each his penny from the Master—"Unto this Last." Then a design of "Sesame and Lilies," and, in the middle, "Fors Clavigera," the Angel of Fate holding the club, key and nail, which every reader of his works will easily recognise. Over that is the "Crown of Wild Olive," and at the top "St. George and the Dragon." The north side is a simple interlaced pattern. The cross-head on one side bears the Globe, symbolising in those old sculptures the Sun of Righteousness, and the other side has a disc, with the Fylfot, or revolving cross, accepted all the world over as the emblem of eternal life. The carving is purposely kept low and flat, bringing out the subjects by touches of shadow, rather than in high surface relief. This is a style hardly, if ever, used nowadays, but was anciently employed with great effect, when the stone was hard and meant for out-of-door light.

Chateau de Belœuil. ON December 16th a destructive fire broke out in the famous Chateau de Belœuil, near Mons, Belgium. The chateau contains a valuable library and many artistic treasures and curios. Most of the rare books in the library have been consumed, and the collection of pictures has also suffered greatly, several works having been totally destroyed, while others have been seriously damaged. The exact extent of the damage cannot be ascertained until an inventory has been taken. Belœuil was one of the finest residences in Europe, and was termed the Versailles of Belgium. It was the seat of the Princes de Ligne, and dated back originally to the twelfth century. But little remained of the early castle, and Belœuil was chiefly famous for its exquisite grounds, which were laid out by Lenotre, and for the art collections which had been formed by successive members of the de Ligne family. Its reminiscences are chiefly of the last century, when it was in the possession of the Marshal Claude Lamoral de Ligne, and, after him, of Prince Charles de Ligne, whose memoirs were among the most interesting records of the aristocratic life of France before the Revolution. Among the art works which it is feared have perished in this calamity are pictures by Rembrandt, Velasquez, Holbein and Pourbus.

Dr. Wallace's Colony. A number of the members of the Land Nationalisation Society are thinking of forming a Home Colony for themselves and sympathisers just outside London. Dr. Alfred Russel Wallace, the president, has long thought of some such attempt which would solve the housing question so far as the inhabitants of the colony were concerned, and greatly help on the social work of the society. An estate of something like 200 acres has been surveyed in one of the most beautiful parts of Surrey, and within half an hour's ride of London. It stands 400ft. above the sea-level, and has some fine woods on it, which would be preserved as part of the recreative and pleasure grounds of the colony. One member has subscribed £5,000, a third of the required purchase-money. The idea is to have co-operative ownership of the land, but individualism in the building of the houses. The building sites will be let on leases of probably 75 years at low rentals, and architectural and other restrictions will be imposed to keep the colony free from ugliness, overbuilding, or any other drawbacks. There will also be a residents' committee of selection, who will have the right to veto the introduction or effect the exclusion of "undesirables."

The Louvre Still in Need of Protection. THE problem of protecting the Louvre against fire has not, it is to be feared, been solved by the recent determination of the authorities to create a vacant space bounded by a stout wall between the picture galleries and the highly inflammable wing of the Louvre occupied by the Ministry of the Colonies. M. Redon, the official architect of the Louvre, is inclined to regard the efficacy of their expedient as very dubious. In his opinion, this makeshift proposal proclaims the extreme peril resulting from the neighbourhood of the Colonial Office, but does little to obviate the danger which is thus officially recognised. What is more, the more or less fireproof zone it is intended to create will not be an accomplished fact for two or three months to come. An endless series of formalities will postpone the carrying-out of the scheme until towards the end of the winter. In a word, thanks to red tape, the Louvre will remain in imminent peril throughout the winter, the most dangerous season of the year, and when the precautions contemplated have at last been taken they will be little better than illusory.

CARVING ON CHOIR STALLS, AMIENS CATHEDRAL, DRAWN BY ARNOLD MITCHELL.

The New War Office. IN a letter to the "Daily News" with regard to a statement made that the site chosen for the new War Office "is found inadequate to the needs of that great Department"; "that modifications have been made to fill these requirements"; and that "these alterations necessitate some curtailing of the courtyard space originally held to be necessary for light and air, and, therefore, do not tend to the improvement of the block of buildings either from a sanitary point of view or from that of mere convenience"; the Earl of Wemyss reminds us that before the foundations were begun, he vainly endeavoured by means of a memorial to Lord Salisbury, signed by 140 peers, to induce the Government to cause a model to be made of the proposed building and site, and also of a suggested adaptation to the proposed War Office of parts of Inigo Jones' design for the Palace of Whitehall, of which the existing Banqueting Hall alone exists. Since then he has looked upon any possibility of reviving the Inigo Jones' design as vain, for the foundations of the War Office are being vigorously prosecuted. But statements quoted on the inadequacy of the present site again raise a hope in Lord Wemyss that the present generation may yet be true to their heritage and duty, and endeavour, as the opportunity has arisen, to glorify that part of London by dealing with it, so far as is still possible, according to the inten tion and designs of England's great architect, Inigo Jones. "It is even now not too late. An architect friend reports to me that the whole site of the new War Office has been excavated to a considerable depth, and the whole covered with about 6ft. of cement-concrete, which will act as a foundation. I understand,' he says, 'that the brickwork will rise directly from this concrete platform; I imagine, therefore, that within reason the walls can be placed as desired.' The answer shows that the work already done would not be wasted; that it is not too late to construct the War Office on a larger and more convenient site; that Inigo Jones may yet have a chance, if enlightened public opinion can be aroused in a matter so vital to the embellishment of our Empire City."

BOTHWELL CASTLE.

THIS was the subject of Mr. G. S. Aitken's recent lecture before the Edinburgh Architectural Association. Having described the situation of the castle—on the north bank of the Clyde, about 8½ miles south-east of Glasgow—Mr. Aitken went on to speak of the present ruin, which consists of the southern portion of the original building, conspicuous for its great western and south-eastern towers and their connecting walls, and occupying a space about two-thirds of its ancient extent. The architectural features of these towers were dealt with, and the mason's marks in the great western tower described. What object these marks served, he said, had not been determined, but the system was certainly very ancient, marks having been found on Egyptian masonry. Some experts supposed them to be symbolic; others that they were cut in the stones to show whose work they were, and how much the workmen were entitled to receive in payment. He would suggest, however, from an examination he had made of the ruins, that while the marks might be the property of particular masons, they also served the purpose of indicating the intended position of each stone in the building. The master-mason, as any modern clerk of works would do, planned the various courses of masonry, marking on his drawing the symbol of each man to be engaged upon them, and allotting in that way to each hewer his work, which readily found its place in the building on reference to the master-mason's original draft. The marks might also have been intended to aid in settling the amount of money that fell due to each, and at the same time assigning to the individual mason the credit due to him for workmanship. Three distinct families, the Olifards, Morays, and the Douglases, have been connected with Bothwell Castle from the time of its origin till the erection of Bothwell House, situated a little to the east, the centre and north wing of which were designed in the eighteenth century by James Playfair. If we examine the details of the various parts of the Castle, and determine their dates, it should not be difficult to find out what share each house had in their erection. We have good reason for stating that the western tower, with its pertinents, enclosed within the inner bailey, was the work of the Olifards, because its detail is Early English, the vogue in their time. We go further and say there is every reason to suppose that they erected a complete castle with the extended outline disclosed by the excavation of 1888. The period of their occupancy from the time of William Olifard, the second justiciary of the Lothians, which was probably about 1180, and the date when Bothwell passed into the hands of the Morays (nearly 110 years), gave ample time to carry it out in its entirety.

It seems clear that no building of any moment could have been done during the occupancy of the Morays from the year 1292 till the date of its dismantling in 1337. The English, who often held possession during this time, were not likely to extend it, and the Scots in their turn had no chance of doing so.

We infer, therefore, that the work was carried out during the time of the Olifards; the assumption is eminently reasonable when we consider that, according to a contemporary record, Caerlaverock Castle, which closely resembles Bothwell in idea, was by this date complete, with its circular towers and curtain walls; and we have besides further confirmation in the condition of castle building across the border, for at an earlier date than we are considering—the reign of Stephen of England—there had been erected 1,115 castles in England, many of them having the full arrangements of a fortalice, so that allowing for the later development of castle erection in Scotland there is nothing unreasonable in assuming that Bothwell was complete prior to the invasion of Edward I., at the end of the thirteenth century.

The dismantling in 1337, intended to render the Castle useless to an invader and at the same time to relieve the owner of the task of defending it, went so far we may suppose as the destruction of the western half of the great tower and the reduction in height of all the rest of the walls and towers. As the Douglases, when they came into possession in 1361, had Tantallon and Douglas Castles, we may presume that with these fortalices they would only restore so much of Bothwell as served for occasional occupancy. If we assume that they confined their restoration to the south part at present standing, this will solve all the difficulties of the date problem by assigning to *them* the erection of the banqueting-hall, chapel, and south-east tower, which are all works of their period. As a matter of course they would make the great western tower available for living in by building the existing cross wall, and also complete their labours by enclosing the area connected with the reinstated Castle by the erection of the present north curtain wall. This theory fits all the pieces of the puzzle together.

Mr. Thomas Ross, who moved a vote of thanks, expressed the hope that the lecture would be fully illustrated when published in the transactions. Mr. James Bruce, ex-president, in seconding, referred to the slide shown of the Douglas arms over the postern—the arms are ermine, a heart, on a chief three stars; he was followed by Mr. Rae Macdonald, "Marchmont Herald," who gave some very interesting information on the heraldry of the Castle. The lecture was illustrated by plans and limelight views.

BRASENOSE COLLEGE, OXFORD.

THE members of the Oxford Architectural and Historical Society recently visited Brasenose College, when the Principal met the party and showed them the chapel, library and hall, giving the history of one or two of the more interesting features. The college was founded by the Bishop of Lincoln and Sir Richard Sutton, of Presbury, in Cheshire, in 1509, on the site of two small Halls, little University Hall and Brazen-Nose Hall. The original knocker from which the latter derived its name was carried away during a quarrel between the students, when a large body of them left Oxford, taking with them the knocker, and founded a new college for themselves in Lincolnshire. It is only within the last six or seven years that this interesting relic has been recovered and placed on the wall over the high table in the hall. The gaily gilt nose, which is a conspicuous feature over the gateway of the college in the Radcliff eSquare, is not in any way like the real knocker, which resembles a leopard's head in bronze. Some handsome candelabra, bearing the name of the donor, have also been recently restored to the institution. Brasenose College led the way in the manner of placing libraries; almost all the old Oxford and Cambridge libraries until the beginning of the 16th century run north and south, facing east and west, the object being to catch the early light. When a luxurious generation began to think more about comfort than length of possible working hours, they built the libraries to face north and south, so as to get the full force of the sun from the south. Brasenose was the first of the fourteen libraries built between the beginning of the 16th century and the Restoration of 1661, all of which face south; and when later this invariable rule was departed from this college led the way with the present library, completed in 1663.

The party then proceeded to Holywell Church, where they were met by the Vicar. Mr. Leigh exhibited some interesting old engravings of the church, showing its development from the original form without the north and south aisles to its present form. Very little is known of the history of the church, which is dedicated to St. Cross, but it is generally supposed that it was of Norman origin. The upper part of the tower was built by a Warden of Merton in the reign of Henry III. The aisles have been added in the present century, and quite recently small clerestory windows have been let into the wall beneath the roof in the south side. Seven or eight years ago the commandments, creed, &c., were removed from above the chancel arch, and the present decoration of angelic figures painted there instead by Mr. Reginald Halward.

From the church the party were taken into the Manor House Chapel, where the ancient well stones discovered during some excavating were shown. This Holy Well is supposed to have supplied the bath chamber of the Warden of Merton before mentioned. The Manor House is a very ancient foundation, and the date of the well stone beneath the chapel is supposed to be about 1488.

Views and Reviews.

Road Making and Maintenance.

This is a practical and comprehensive book for the use of students, municipal engineers and surveyors, and others. The work consists of two parts, the first dealing with the making and maintenance of macadamised roads, and the second with carriageways and footways. The arrangement of the matter is systematic, and, speaking generally, we find it largely follows that adopted in the "Construction of Roads and Streets" by William H. Maxwell, A.M.I.C.E. This is particularly noticeable in the case of the "Historical Sketch," some portions of which to us read uncommonly like a paraphrase of a similar chapter in Mr. Maxwell's work. Suggestions for the planning of other chapters, such, for example, as the "Laying Out of New Roads" (Chapter II.) and "Earthworks, Drainage, &c." (Chapter III.), have, we think, also been gleaned from the same source, although we do not find that any acknowledgment has been made. Many books have been written upon this subject, but the present work will be found a useful, up-to-date and exhaustive compilation of all the principal data which can be collected upon the questions treated; the author's apology for its publication being found in the fact of the recent introduction of mechanical appliances for quarrying, manufacturing and consolidating the metalling which has led to important changes on the older methods, whereby more expeditious, effective and economical work has been rendered possible. The transfer of the management of highways to county councils by the Local Government Acts has also afforded scope for road maintenance on a larger scale than has hitherto been practised in this country, and in this the author has had an experience extending over many years which has enabled him to bring together much useful information on the subject, and to more particularly set out his own views upon the various questions raised in the concluding chapter, which is a "Recapitulation" of the preceding pages. This, to the experienced engineer and surveyor, will, we think, be found the most interesting portion of the book, giving, as it does, sound practical views evidently matured from the author's own daily experience and savouring of the freshness of originality.

It would be impossible in the course of an ordinary review to thoroughly analyse all the various chapters of Mr. Aitken's book, but a reference to some of its more salient features will be of interest to our readers. In the "Historical Sketch" the evolution of road-making as a science is traced from the time of the Romans to that of Telford, who was the first to really establish sound engineering practice in roadmaking on the lines adopted at the present day. The usual information upon "Resistance to Traction," with interesting tables and data, is to be found in Chapter I., which is followed by a general description of the preliminary operations of the engineer in settling upon the lines and levels of a new line of communication. To the young engineer this will be found a useful and instructive chapter, and is accompanied by large plans and sections of a proposed new roadway and of the suggested improvement of an existing line. Earthworks, methods of drainage, the design of retaining walls, culverts, and the use of coffer-dams, cylinders and caisson foundations and other constructional matters in connection with bridges are discussed at some length. An omission is to be noted in Fig. 16 (page 57) in which the "natural slope" should have been shown "benched" where embanked upon, which is an important detail in practice. A

short reference to the importance of the bearing of geology upon the subject under treatment opens a useful chapter on "Road Materials," but having regard to the great importance of geological considerations to the road-maker, the reference made is too brief to be of service, and might, we think, have been extended with great advantage in a work of this character. A novel feature is to be found in the admirable chapter on "Quarrying," which is full, practical, and well illustrated, and is certain to well repay careful perusal by those borough and county engineers and surveyors who have to quarry a large proportion of the stone used upon the roadways under their charge. The same remarks also apply to Chapter VI. on "Stone Breaking and Haulage." Both subjects are treated in a practical manner, with details of cost and other data. Chapters upon road-rolling, scarifying, and the maintenance of existing roads complete Part I. of the book.

Part II. consists mainly of descriptions of the various forms of pavement for carriageways and footways, and gives well-known information condensed from various other works. With the greater portion of the matter contained in these chapters the experienced surveyor will already be perfectly familiar, there being comparatively little that is new—the "conclusions" of the author, however, on page 372 will repay perusal. Next follows a chapter upon the interesting question of "subways," and the subject is treated at some length but not illustrated, which certainly would have added considerably to the value of the chapter. In all, the work consists of 425 pages of matter, and must have involved a large amount of labour, as nearly all the principal works on the subject appear to have been searched and selections abstracted and condensed from them, resulting in a very useful work of reference, which every interested student would do well to study. There is an excellent index, and the book is well produced; it should prove a useful acquisition to the library of every municipal engineer and surveyor.

"Road Making and Maintenance," by Thomas Aitken, A.M.I.C.E. (London: Charles Griffin and Co., Exeter Street, Strand, W. Price 21s.).

CHIMNEY CONSTRUCTION.*

BY E. J. PHILIP.

IN designing a chimney for any given purpose the first question is, "What is the chimney for, or what is it to do?" For instance, if it is to produce draught for ventilation it will not require to be lined with fire-brick, nor will there be any benefit in putting in a loose lining. We will suppose the chimney under our consideration is to induce draught to burn coal.

The size of the flue is the first dimension you will require, and it will depend on the quantity of coal to be burned and the velocity of the gases up the shaft. It is easily understood that as chimney powers increase the dimensions do not increase proportionately. To illustrate this I will take some figures from a table in a reliable work:—

A chimney 70ft. high, 30in. diameter = 100 h.p.
" " 200ft. " 66in. " = 1,000 h.p.

That is, the high chimney with five times the area equals ten times the power; and while I am not sure that this proportion is right, it seems to illustrate the way the formula works. The only correct way is to calculate the number of cubic feet of gas going up the chimney at the average velocity, and the area of this column is the area of the chimney. The rate of combustion depends on the draught, and the draught depends on the height of the chimney and the temperature of the gases. The height of the stack is nearly always determined by the surroundings, as the stack must of necessity be above any buildings or hills; I might say that the average stack is higher than is necessary. However, when there are no buildings or hills, the following formula will establish the height. This is known as Gale's formula:—

$$H = \frac{120}{T}\left(\frac{F}{g}\right)^2.$$

After getting the height, the area may be obtained by Kent's formula, which is: $A = \frac{\cdot 06F}{\sqrt{H}}$.

In this rule the effective area is obtained, and is 2in. less all round than the actual area. This 2in. is to make up the friction of shaft. We now have area of chimney and height of it. I might say that experience has shown that to burn hard screenings requires a 175ft. stack, for buckwheat 150ft., and for soft coal 80 to 100ft. This is a pretty fair basis to start from. We will suppose our chimney is, say, 100ft. high and 40sq. ft. in area. It seems, with this information, a simple matter to construct a stack; and so it is, only you must go about it in the right way. To continue your calculations after getting the size, you start at the top and work down. Authorities say that a chimney having a flue over 5ft. in diameter shall be 1½ bricks thick at the top; from 3 to 5ft. in diameter, 1 brick; and under 3ft., ½ brick. A chimney 5ft. or more in diameter would have this size for the first 25ft. down, and would increase ½ brick for each 25ft. This, according to calculations, is almost too much. It can run 30ft. to 40ft. each stage, but will depend on the kind of material—that is, whether hard or soft brick, and whether built in cement or lime; 30ft. to 40ft. is suitable, with good material and workmanship. Having laid out the different thicknesses of wall, and knowing the batter, which varies with different builders and conditions from $\frac{1}{16}$in. to $\frac{3}{8}$in., you can determine the weight of the shaft or chimney proper. In large chimneys it is usually specified what they shall weigh per cubic foot. After determining the weight you can decide how much bearing surface you will require for the kind of soil you have at the foundation. Various bearing powers of soil are given as follows: Hard rock, native bed, 100 tons sq. ft.; clay, dry, 4 to 6; moderate dry, 2 to 4; soft, 1 to 2; gravel and coarse sand, 8 to 10; sand compact and well cemented, 4 to 6; clean dry sand, 2 to 4; quicksand and alluvial soils, ½ to 1 ton per sq. ft.

When the ground is soft you would require piling or timbering, and will need to spread it out over a considerable area. The weight in tons divided by the bearing power of soil gives the area necessary. Wind-pressure is also an important factor in determining the area of the base. I will not go into the rules affecting wind-pressure, but experience has shown that at the base of the shaft proper its diameter shall be one-tenth of height for a square chimney, one-eleventh for an octagonal one, and one-twelfth for a round one. In considering wind-pressure it is usually figured at from 25 to 56lbs. by different authorities. This must be resisted by foundation, as if the chimney rocks over with wind it will throw its entire weight on one side of the foundation. In considering wind-pressure it is necessary to take into account whether the chimney is protected by buildings or standing in an open field. If the chimney is built into a building, wind-pressure may be almost disregarded, except for the portion above the roof.

A great deal has been said about the merits of different-shaped flues, but experience and tests have shown that a parallel flue is the best, or as good as any other shape. The arguments for taper flues are something like this, that the velocity of the gases as they ascend is diminished by their cooling, and consequently they require more room, and the flue should become larger; others say that the gases cooling down contract in volume, and therefore the flue should get smaller so as to take the same shape as the column of gas. Experience has shown that both contentions are correct. The gases contract and get smaller and consequently need less room, but their velocity also diminishes, due to their greater weight, and they therefore need more room. In this way they balance and require a parallel flue. Some authorities say a round parallel flue is the best for all purposes.

The chimney should be finished with a cap of some material that will stand the weather. I like cast-iron best, but a cap can be moulded of Portland cement, or if the stack is for smelting work, of fireclay. These materials stand well, and if there is a ladder on the chimney they can be kept in repair. A ladder should always be built on the shaft, as it provides a means of examining it at any time, and if repairs are needed they can be done easily.

Lightning conductors are also approved and disapproved; but if a chimney is the highest object in its vicinity it is likely to take the discharge from a storm over it, and a properly-erected conductor will carry it off, although many stacks are standing without any.

* A paper read before the Canadian Association of Stationary Engineers.

Surveying and Sanitary Notes.

Trinidad Asphalt.—The Colonial report recently presented to Parliament for the year 1899 states that of the mineral products of the island of Trinidad, B.W.I., asphalt is by far the most important. The Trinidad asphalt trade was more prosperous in the year 1899 than in any previous year of its history. One hundred and forty thousand tons were exported.

A New Pavement.—The United States Consul at Hamilton, in Ontario, states in a recent report that the city authorities there have, after years of experiment, discovered a pavement for streets that is durable, excellent, and cheap. The tests, which have been made over a number of years on business streets, show that tarred macadam makes not only a smooth and solid roadway, but that it can be maintained and repaired at very little expense. The first cost in Hamilton is from 3s. to 3s. 8d. per square yard, and the authorities estimate that the cost of repairs in streets with heavy traffic is less than ½d. per yard per year, while ashphalt costs over 1½d. By the addition of tar the road becomes impervious to water, is proof against frost in winter, and mud and dust are prevented in summer. It is easily repaired and does not require scraping, so that much of the wear of the surface is avoided. Success, however, depends on the care with which the road is laid down at the outset. Either stone or cement kerbing is placed before the road is commenced. The base consists of cement laid on broken stone or gravel, which is freely rolled with heavy rollers, the curve being designed to carry off water quickly. Upon this a solid bed of stones, at least 6in. in thickness, is placed, the interstices being filled with small stone and gravel, well rolled in. Over this comes a coating of gravel, rolled hard, and then a layer of stones saturated with tar, the stones not exceeding 2in. in diameter. These stones, before being mixed with boiling tar (8 to 12 imperial gallons to the cubic yard), must be thoroughly dried, either in the summer sun or by exposure on heated plates, until all the moisture is expelled. After a thorough rolling, another stratum of tarred stone of the same thickness and dimensions is added, rolled, and covered with a layer of gravel and quarry chips, also mixed with tar. A top dressing of screenings is then added, and if a light colour is desired it can be obtained by adding cement. Most of the stone used in Hamilton is machine crushed; limestone is used because it is abundant locally, but granite or flint would absorb less tar and bear more wear and pressure.

A Bronze Statue of Gutenberg, the crowning figure of a handsome monument to the father of printing, has been unveiled in Vienna. It stands in the shade of five-storeyed houses, in a small square facing the busy thoroughfare which leads from St. Stephen's Cathedral to the Danube Canal. Gutenberg stands upright and very tall, in a long mantle, and wearing a broad cap. Behind the statue rises an enormous building erected quite lately on the site of one of the most interesting old Vienna houses, the Regensburger Hof. That old house, if it were still there, would be a fitting background to the mediæval statue. On the pedestal a relief in marble shows the Awakening of Man, the rays of the sun being made to symbolise the art of printing.

Law Cases.

Artistic Copyright in the Colonies.—In the Superior Court at Toronto on November 6th, Mr. Justice Rose delivered an important copyright judgment in the case of *Graves* v. *Corrie*. The question at issue was whether the Act passed in 1862 (25-26 Vict, c. 68) for amending the law relating to copyright in works of the fine arts, and for repressing the commission of fraud in the production and sale of such works, extended to the colonies or was confined to the United Kingdom. The decision was in favour of the latter reading of the Act. The Act of 1842 which governs literary copyright does extend to the colonies, as the wording explicitly states. The "Times" correspondent says: "This is, I believe, so far as reported decisions go, the first to decide definitely that a copyright in the fine arts printed in the United Kingdom is confined to the United Kingdom. As suggested in the judgment, this may possibly have been an oversight, but what seems more likely is that in 1862 the British Parliament did not feel as free to legislate for the self-governing colonies on copyright as it did in 1842."

Mischievous Boys: a Good Precedent.—At the Ipswich County Court *Thomas Parkinton and Son*, builders, recently sued *J. H. Wrinch*, barley merchant, for £13 for damage done by defendant's children to ladders, poles, scaffold boards, &c.; damage done to mortar, sand, and bricks rendered useless; and damage to work in course of progress. Mr. Low, for the plaintiffs, said that his clients were engaged in enlarging 45 Fonnereau Road, Ipswich, where defendant and his family resided. The work was commenced in May, and finished in the early autumn. Defendant had three sons, and during the whole of this time, whenever they had the opportunity, they devoted spare time and energy to causing plaintiff and his workmen inconvenience and annoyance, and doing all the damage they possibly could. They were very energetic. For instance, a great part of their time was devoted to putting stones and pieces of brick into the mortar; they broke the scaffold boards, swarmed up the ladders, and Saturday afternoons especially they devoted to demolishing any fresh brickwork they could find about. Complaints were made to Mr. and Mrs. Wrinch, but instead of the lads being restrained or punished, the father said boys would be boys. The jury awarded plaintiff £10 10s. They found that the boys did do the mischief, and that the defendant knew the mischief was going on, though he took no steps to stop it.

An Important Case relating to the Use of Sewers.—In the Queen's Bench Division of the High Court of Justice on December 14th the case of the *London County Council* v. *The U. D. C. of Acton* was heard before Mr. Justice Ridley. In this case the plaintiffs claimed to recover from the defendants the sum of £225 9s. 5d. and interest, pursuant to the London County Council (Acton Sewage) Act, 1898, for the use of the metropolitan main drainage system. The defence was that the plaintiffs were only entitled to recover £97 16s. 6d., which sum the defendants paid into Court. His Lordship, in giving judgment, said that the case was one raising questions of importance, and if he had been in any doubt as to his decision, or if there had been no such case as that of the *Islington Vestry* v. *Hornsey Urban Council*, he should not have delivered any opinion at present. He thought, however, that the case he had mentioned covered the point in question. In 1855 the new Metropolitan Management Act passed, and the Metropolitan Board of Works became managers of the districts within their boundaries and owners of the sewers. The result of this was that the Stamford Brook (East) and a portion of the Stamford Brook (West) were in their district, whilst the remainder of the Stamford Brook (West) was in another district. Houses in Acton at this time were sending sewage through these two sewers, and they had acquired a right so to do. Then a new state of things began under which the houses in the Acton district were not included in the metropolitan area, whilst a portion of the sewers were. Population increased and fresh houses were built, with a consequent increase in the quantity of sewage passing into the sewers. Nothing appeared to have been done until an action was brought against the Acton Local Board in 1882; and an injunction was granted preventing the Acton Board in the future from discharging more than a fixed quantity of sewage into the sewers in question. So there was a period between 1855 and 1882 during which an increased quantity of sewage had been delivered into the Stamford Brook sewers, and the question now arose was that sewage which had been so discharged for that period of time within the words to be found in section 3 (*a*) of the London County Council (Acton Sewage) Act, 1898. If it was so included, the defendants were right; if not the plaintiffs must win. It appeared from the cases of the *Attorney-General* v. *The Acton Local Board* and the *Metropolitan Board of Works* v. *The London and North-Western Railway Company* that after the constitution of the Metropolitan Board of Works the latter could not allow persons outside their districts to drain into it, because the words "any person" in the Act of 1862 were construed not to include any one unless they were in the district. If that was correct, it followed also that you could not, being a person outside the district, acquire by prescription the right to drain your premises into any sewer which had the benefit of draining into the metropolitan drainage system. The recent case of the *Islington Vestry* v. *Hornsey Urban Council* appeared to him to decide this very point. It seemed to him, therefore, that it followed from the decisions referred to that the houses which were getting the benefits of these drains between 1855 and the period he had mentioned were not doing so by way of prescriptive right, and if they were not it seemed to him to be clear that the words "houses or buildings having acquired a prescriptive right to drain into the Stamford Brooks Sewers," appearing in the Act of 1898, must refer to and be satisfied by such houses or buildings as had used the sewers before the passing of the Metropolis Management Act. It had been contended on behalf of the defendants that the words "acquiring a prescriptive right" had no reference to the metropolitan district system, or to persons outside the district acquiring rights to drain into it, but simply to the fact of houses acquiring a right against the Acton Local Council. He did not think that view was in accordance with the general intention of the Act, which was dealing with the question as to how far the Acton district was to get the benefit of the metropolitan drainage system. It was not a question between certain houses and the Acton Council with which the Act was dealing, but between such houses and the metropolitan district. On the points submitted, therefore, he decided in favour of the plaintiffs. Judgment was given accordingly, the exact amount to be paid being left to be settled subsequently.

Athenian Buildings.—A lecture was delivered last week on this subject before the Sheffield Society of Architects, and Surveyors, by Mr. Hugh Stannus, F.R.I.B.A. The lecture formed a comprehensive and interesting guide to the ancient buildings of Athens. Aided by a number of excellent lantern views, Mr. Stannus conducted his hearers round the city, pausing to describe the temples, and pointing out their architectural characteristics. He dealt fully with the beautiful little temple of Nikê Apteros, then went up the hill, around the Parthenon and the Erectheion. Descending, he showed the Dionusas, the Choragic monuments, the Olympieion, the Theseion Agora, and the Temple of Winds. At the conclusion of his lecture on Athens, he dealt briefly with some of the temples of ancient Sicily. A vote of thanks was accorded to the lecturer, on the motion of Mr. C. Hadfield, seconded by Professor Anderson. A ballot was taken, and the following gentlemen were elected:—Fellows, Messrs. W. J. Hale and H. L. Paterson; associates, Messrs. G. R. Morris and H. W. Inott; students, Messrs. H. W. Wilson and J. Miller.

Professional Practice.

Broughton.—The New Victoria Theatre, Broughton, has been erected from the designs of the well-known theatre architect Mr. Bertie Crewe, and is situated at the junction of Great Clowes Street and Sussex Street. The site is open to no less than three streets, thereby insuring sufficient exits to secure the safety of the public. The main front to Great Clowes Street is a highly ornamented one of red terra cotta, containing the main entrance to the theatre and three spacious shops. The front is divided by Ionic pilasters into five bays, the centre one surmounted by a carved pediment, above which is an attic storey, finished with a copper dome and light iron cresting. Covering the main entrance is a canopy of hammered iron and leaded glass, while at the pit and gallery entrance in Elton Street another canopy is provided for the shelter of those waiting at the doors. The front at night is illuminated by arc lamps and the stained-glass windows of the building. Entered from the main entrance doors is the vestibule, about 24ft. by 16ft., with marble mosaic floor, marble dado, and painted ceiling. On the left hand of this apartment is the booking office, where the money taken to all parts is controlled in one room. On the right hand side is a broad and easy stair to the balcony, and facing the entrance from the street the vestibule opens direct into the grand foyer. This is a spacious hall, 34ft. by 18ft., also with marble mosaic floor, walls panelled in fibrous plaster, and hand-painted ceiling. From the foyer are the corridors leading direct to stalls, dress circle, and grand saloon. The entrance hall and foyer are lighted by no less than seven hammered brass electroliers. The auditorium is planned upon the composite two-tier principle, having stalls, pit stalls, and pit on the ground tier; dress circle and balcony, so divided that the lowest row of the latter is some 6ft. above the back row of circle, on the first tier; and the gallery on the second tier. The decorations of the house are in the style of Louis XIV., there being an ante-proscenium, with two boxes on either side at different levels to the circles, the openings on stall level being used for the stalls entrances. The prevailing tones are ivory and gold, with sparing use of copper bronze, the upholstery and hangings being in a deeper tone of copper. Specially designed electroliers in accordance with the style form actual portions of the decoration of proscenium, circle and ceiling. The whole of the theatre, both before and behind the curtain, is lit by electricity, generated by the proprietors' own plant, which has been placed in such a position that no noise or vibration can be detected in the theatre. Gas is also laid on as a stand-by. There are saloons decorated and lit in keeping with the auditorium. The grand saloon for dress circle and balcony is 42ft. long by a maximum width of 25ft. The occupants of the orchestra stalls have their own little saloon on the level, thus obviating the nuisance in so many theatres of the stall-people having a long weary climb to the refreshment saloon. The stage is 40ft. from curtain line to back wall, 74ft. in width, and 50ft. from stage to grid. The proscenium opening is 30ft. in width. There are no less than eighteen dressing rooms, well lighted and ventilated, with hot and cold water laid on, and property rooms, &c., as well. The entire building, including decoration and scheme of lighting, has been designed and personally superintended by the architect, and the building has been carried out by Messrs. W. Brown and Son, of Trafford Road, Salford, who also are responsible for the gas-work and heating. The constructional steel work is by R. Moreland and Son, fire appliances and ventilation by Messrs. Vaughan and Brown, granolithic cement by Messrs. A. J. Phillips and Co., mosaic pavings by Messrs. Drespelles and Co., marble dadoes by J. Whitehead and Co., decorations by J. Burns and Sons, stained glass by Charles Evans and Co., furnishing by Turner, Son, and Walker, and the Jones panic bolts are fitted throughout.

Hinckley.—The new church of St. John the Evangelist was opened recently. The founda-

tion stone of the half of the new church which is already erected was laid by the Bishop of Oxford in June 1899. The total cost of this part is estimated at £5,905. The church, when completed, will consist of a nave of five bays and a chancel of three bays, and will have a total length of 130ft., exactly one-half of which, consisting of the four western bays of the nave, is now built. The chancel will be separated from the nave by transverse arches, but otherwise there will be no structural difference between these two parts of the church. The boarded ceiling, the apex of which is 41ft. from the floor, will be the same throughout. The two aisles will also run from one end of the church to the other without further break, and with the nave they make a total width internally of 57ft. There is no clerestory, and the aisles are separated from the body of the church on each side by a row of seven pillars 20ft. high. The windows are also all of one pattern on each side, but the design of the two aisles is different in every respect. The wider aisle and that with the higher wall is on the north side. It will have seven windows of five lights each, four of which are already built, and a porch and parvis will occupy the next and easternmost bay of the nave. The nearly flat roof of this aisle is surrounded by a battlement. The other aisle has a more sloping roof, the lead of which shows outside, and the heads of its four-light windows are flattened. The difference between the aisles is further emphasised by the painted decoration of their ceilings. The rafters are white throughout, but the boarding between is counterchanged with squares of red and green in the north aisle, and in the south aisle it is all a red ground, upon which the sacred monogram changes with the eagle for St John. The eagle and the chalice are also blazoned on the corbels which terminate the principals, interchanged with the gridiron, which shows the connection with St. Lawrence, the mother church of Hinckley. The nave roof is divided by red and green ribs into white squares, powdered with roses, which will give place in the chancel to blue, with gold stars. The manner of the window tracery is somewhat of a compromise between the Florid and the Perpendicular, and the mouldings are of the latter type. The church also has the general features of spaciousness and lightness which are characteristic of the later English Parish Church. Such of its ornaments as have yet been obtained are also of this type, as the high steps for the font in the midst of the west end of the nave and the long and low reredos to the altar, which now stands beneath a blue tapestry, hanging against the temporary east wall, but will take its place eventually beneath the east window. Externally the building is of red brick and stone; but within only the stone and plaster show, and the windows are glazed throughout with large roundels, in the manner of the Bavarian churches. The west front, like the sides, has large windows and deep buttresses, one of which is surmounted by a small steeple, which carries the bell, and a somewhat similar turret will mark the division between the nave and the chancel. The architects are Messrs. Bucknall and Cowper, of Old Queen Street, Westminster, and the builders Messrs. Kingerlee and Sons.

London.—The Working Lads' Institute, Whitechapel, E., was re-opened recently after undergoing extensive alterations. It was erected originally from the designs of Mr. George Baines, F.R.I.B.A., about fifteen years ago, in sections, the last portion being a lecture-hall with swimming-bath under. This portion of the property was recently compulsorily acquired by the Whitechapel and Bow Railway Company and has been pulled down. The remainder of the premises has been remodelled for the purposes of the institute, the old reading-room on the first floor being enlarged by the addition of another room, the two together now forming a large lecture-room, the reading-room being transferred to the floor above. New caretaker's rooms in the rear, and a new retiring room to the lecture-room have been added, and the whole premises have been decorated. The work has been carried out under the superintendence of Messrs. George Baines, F.R.I.B.A., and Reginald Palmer Baines, architects, 5 Clement's Inn, Strand, by Messrs. Turtle and Appleton, St. John's Hill, Clapham, at a cost of about £1,300 inclusive of Electric Lighting throughout.

London.—The Grosvenor Hotel, which has been reconstructed internally, has just been opened under the management of the Gordon Hotels, Limited. The Grosvenor was erected in 1862, and was the first of the great modern hotels in the West End of London. It is situated at Victoria. In reconstructing the hotel the whole of the first and second floors have been completely altered. A glass-covered lounge has been fixed over the entrance, which gives a view up Buckingham Palace Road. The grand hall forms the centre of the building. Its decorations are very light, the pilasters being of veined marble, and the panels of alabaster. Grey marble and alabaster have also been used for the balustrade in the lower part of the stairway. At the head of the first landing there is a painting of an Italian garden scene by Mr. Breakspear. The hall, which has a marble floor, is arranged as a lounge, and the galleries which run round it have been redecorated. The reading and reception room is an attractive apartment, worked out in the Italian style with salmon-coloured silk panels on the walls and green drapery. Carved oak has been used for the wainscotting of the smoking-room, and the furniture throughout the room is in shades of brown. In the billiard room, also, there is a high-panelled oak dado, with a richly-modelled frieze. The dining room has been doubled in size, and will now accommodate more than 200 people at separate tables. It has a mahogany dado, a large mahogany mantelpiece, red curtains and draperies, with embroidered valances and crimson silk panels. The corridors are much more commodious than those of the new hotels, and are used as lounges. On the first floor a large reception room has been made into private suites of rooms furnished in various styles, with silk panels. The hotel contains all modern requirements, and is well furnished; the electric light fittings are made of hammered metal or brass; and the sanitary arrangements have been entirely remodelled. The hotel entrance to the Victoria Station of the London and Brighton Railway has been rearranged. In the station itself the company are carrying out very large extensions, a part of the scheme being an additional wing to the Grosvenor Hotel over the booking office, which will double the number of bedrooms and give the hotel another frontage. The reconstruction has been carried out under the direction of Mr. A. Waterhouse, R.A.

Middlesbrough.—An extensive scheme of alteration and improvement in the New Theatre Royal has just been finished. The work of reconstruction was placed in the hands of Messrs. Hope and Maxwell, architects, of Newcastle-on-Tyne. Principal entrances have been provided in Sussex Street, and dressing-rooms and bars have been built outside the walls of the building. This addition gives a very much enlarged area to the auditorium, and allows for a stage 12ft. deeper than before, besides providing for four private boxes. The scheme has also provided ladies and gentlemen's cloak rooms and lavatory accommodation. Messrs. A. R. Dean and Co., of London and Birmingham, are responsible for both the decorations and furnishing. Separate tip-up chairs have been provided for both the upper circle and pit stalls, whilst cushioned seats have been provided for the pit and amphitheatre. A new act-drop has been designed by Mr. Conroy, portraying characters from the principal Shakespearian plays.

A new Theatre at Ayr is to be erected in place of the present Ayr theatre, which has been in existence for about seven years and is of wood. The new building will be constructed in the Carrick Oval ground, and will have accommodation for 1,100 people. The accesses to the ground will be improved. A site has been secured for another theatre. The site is in the Dalblair grounds, in close proximity to the railway station, and the structure is estimated to cost £6,000.

New Patents.

These patents are open to opposition until January 28th.

1899.—Self-closing Taps.—24,216. J. E. COWEY, 33 Holborn Viaduct, London. The valve is provided with a cavity at each end, the rear cavity receiving a plug and serving as a dash-pot and the front cavity receiving the inner end of a spring-controlled stem. By this means the pressure of the water against the valve is largely overcome when the stem is pushed in, thus requiring a very small effort on the part of the user.

Lever Hand-Presses.—24,568. S. R. S. BATLEY, Prestonpans Villa, Chandlers Ford, near Southampton. In this invention the principal wearing parts are above the die or brick-box and are so kept cleaner, lasting longer. The machine is well balanced

Wood Flooring.—25,145. W. SHOOSMITH, 5 Eastern Road, Brighton. As a provision against the swelling and shrinkage of wood flooring blocks, a course of spring blocks or a run of elastic material is provided at intervals, forming an expanding and contracting joint.

1900.—Paving Material.—1,915. C. A. C. CAUDEMBERG, 43 Rue Colta, Nice, France. India-rubber is dissolved in turpentine and with it is mixed powdered asphalt. This mixture hardens quickly and forms an elastic, dense and solid layer.

Freezing of Water in Pipes.—3,331. A. NÜESCH-SAXER, Flawil, and R. NÜESCH, Als ätten, Switzerland. This apparatus is characterised by a double-seat valve, the spindle of which (in the form of a pipe) has an opening between both the valve heads and is connected with the rising pipe by a stuffing-box and by a lever fixed on the rotatable pipe. By these means the inflowing water can be stopped and the water still remaining in the rising pipe run off; or the reverse can be done.

The following specifications were published on Saturday last, and are open to opposition until February 5th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—21,971, MCDONALD, fittings for lavatory basins. 23,572, BOEHNDEL, gas for illuminating and heating purposes. 23,667, RITTMAN (*De Saint Hubert*), brick-pressing machines. 23,734, BOUILLET, electric-lighting or heating apparatus. 23,820, DOULTON, water closets. 24,383, CHANDLER, CHANDLER AND KIRKHAM, HULETT AND CHANDLER, LTD., apparatus for washing gas. 25,541, JARVIS, construction of closet pans, &c. 25,584, BAUDISCH, means for protecting river embankments. 25,622, LUNDBERG AND LUNDBERG, method of fitting the covers of electric-light fittings to their base parts.

1900.—403, HOLGATE, machines for sawing stone, marble, or other substance. 1,428. J. DUCKETT AND SON, LTD., DUCKETT AND BULLOCK, water closets and flushing cisterns. 1,579, KEIGHLEY brushes and apparatus for applying paint. 1,662, OATES, urinals. 1,743, GLEN, refuse destructors. 1,756, WEHRMANN AND BASTIANS, suspension devices for arc lamps. 2,041, ROSS, portable drilling machines. 2,907, ELLIS AND WESTCOTT, sanitary systems for ships. 4,302 MOORE, pumps and valve chambers. 4,309 KAYES fireproof pulp for boards, &c. 4,813 BACHE springs and fittings for dancing floors. 7,136. DÜNKELBERG, moulds for bricks. 14,054, JULIUS SAX AND CO., AND AIRD, indicators for electric bells. 14,208, CHAMBERS AND CHRISTIAN, device for preventing the rattling of windows. 15,960, GABRIELLI (late GIUSEPPE), fireproof coating for walls and floors. 16,248, DAVIES, KENT AND STEWART, electric wall or floor coupling sockets. 16,393, DINGLE AND URQUHART, chimney cowls. 17,039, BÜHL, automatic saw-sharpening machines. 17,139 TERLIN, drawing compasses, dividers, &c. 17,607, TRAVERS, hot water or steam radiators. 18,997, SAND-

STROM, spring hinges. 19,224, SOMMER, filter press. 19,268, WANGELIN, water-supply or flush tanks. 19,379, DUCKETT AND BADGER, machines for sand-mouldings. 19,410 COPLANTZ, extensible ladders.

Engineering Notes.

Boiler Explosions.—The eighteenth report of the Board of Trade on boiler explosions for the year ending 30th June last states that 24 persons were killed and 65 injured by these explosions; though the loss of life compares favourably with preceding years, the number of persons injured exceeds the average for the same period. Only seven cases are attributed to ignorance or neglect on the part of boiler attendants, and under this head the figures for the last ten years seem to indicate that a steady improvement is taking place.

New Dock Works at Burntisland.—Very satisfactory progress continues to be made with these works, and they will probably be completed by the middle of next summer. The outer embankment has been run westward for a distance of about 800yds., and from the west point of this wall shorewards to the old harbour head an extensive coffer-dam, about 580ft. long, has been constructed in order to keep back the water from the area within which the new wet dock had to be constructed. These outer works have accounted for a large portion of the time that has elapsed since the works were commenced early in 1897. The original plans have been altered and enlarged so as to increase the water area of the dock from 8 to 12 acres, the extreme length of which is about 1,300ft., and the width from 180ft. to 700ft. The concrete walls are 40ft. in height from the foundation to the coping. In width the walls are 14ft. at the base, and the coping consists of Norwegian granite blocks, about 3,000 tons having been imported for that purpose.

Masters and Men.

The new Isolation Hospital, Chinley, is being warmed and ventilated with the patent Manchester stoves and grates supplied by Messrs. E. H. Shorland & Brother, of Manchester.

Northern Building Trade Dispute.—At the half-yearly meeting of the Lancashire, Cheshire, and North Wales Building Trades Employers' Federation at Liverpool it was decided to support the Newcastle employers in the dispute which has arisen between them and the bricklayers. The employers at Blyth have also locked out the bricklayers' labourers and stonemasons and this extends the dispute to several districts.

Trade Unions in 1899.—A Board of Trade report on Trade Unions in the United Kingdom gives statistics for the period 1892 to 1899 relating to 1,685 unions. The number of unions on the list at the end of 1899 was 1.292, the membership of all at the end of 1899 being 1,802,518, an increase of about 20 per cent. since 1892 The total membership last year rose from 1,649,231 to 1,802,518, an increase of 153,287, or 9 per cent., the greatest proportionate increase in any of the eight years covered by the report. The rise is general. There has been an increase in 1899 over 1892 also as regards income and funds, and a decrease in expenditure. Out of an average yearly expenditure for eight years of £1,503,890, 21 4 per cent. was expended on "dispute pay," 59 8 per cent. on unemployed and other friendly benefits, and the rest in management. In 1889 "dispute pay" absorbed only 9 4 per cent.

East Clandon Parish Church has been restored under the direction of Mr. T. G. Jackson, R.A., at a cost of £2,000.

Keystones.

At St. Paul's Church, Haggerston, N.E., as a memorial to the late Rev. S. J. Stone, a brass and choir vestry are proposed to be added, and the west windows filled with stained glass.

The new Euston Theatre of Varieties, facing St. Pancras Station, London, has been opened. The architects were Messrs. Wylson and Long, and the builders were Messrs. Kirk and Kirk. The external elevations are carried out in red brick and terra-cotta. Mr. Boekbinder has done the interior decorations.

Paintings in a Workhouse.—The wards of Kingston Workhouse have been decorated with copies of Raphael's cartoons. These parochial officials evidently do not consider that a kind of orderly squalor is the proper atmosphere for a building in which paupers are housed. These copies, it appears, were painted some time ago by an inmate of the workhouse.

The new Swimming Bath for Weston-super-Mare.—A Local Government Board enquiry was held recently in reference to an application made by the Weston-super-Mare Urban District Council for sanction to borrow £9,819 in connection with the construction of a new swimming bath. The bath pond is proposed to be 100ft. by 35ft., lined with glazed tiles, the depth of the shallow end being 4ft. 9in., and the deep end 8ft. 3in. Included in the accommodation is a spectators' gallery seating 400 persons. The building will be lighted with the electric light.

A new Fire Station at Paddington has been erected in the Edgware Road, W. The total cost of the site has been £7,195 15s. 9d. The work has been executed by the Works Department of the Council, the manager of works having agreed to execute the work for the amount of the architect's estimate, viz., £13,210, with an addition of £98 for stoves. The entire cost of the site and building has therefore been £20,503 15s. 9d. The front (comprising two main blocks) to Edgware Road is built principally of red brick with Portland stone dressings. The building will accommodate a station officer, nine married men, and two coachmen, and contains stabling for four horses. The station is lighted by electricity, and is equipped with a steam fire engine, a horsed escape, and a hose cart.

Paisley Abbey Restoration.—In the proposed Paisley Abbey and Clark Town Hall surroundings improvement scheme the principal feature is the clearing away of the Abbey Close Church and all the houses and other erections on the ground between the present site of that chuch and Ellis Lane, with a view to the exchange with the Abbey Close congregation of their present site for one to the south looking up Abbey Street. It is also proposed to clear away all the houses, &c., from the Place of Paisley in Abbey Street, as far as the Graham Institute in Cotton Street. The scheme, too, contemplates the laying-out of the Abbey Churchyard, and its maintenance as an open space. In the same manner the other portions of ground cleared of erections will be laid out and maintained as open spaces. The total estimated cost is £20,000.

King Oscar and Archæological Research.—King Oscar of Sweden and Norway has given a sum of 10,000kr. towards the archæological researches of Dr. Lennart Kjellberg in Asia Minor and the island of Lesbos. Dr. Kjellberg had just issued a report upon his preparatory journey last spring in those parts in order to frame a programme for his pending researches. Together with the well-known German archæologist, Dr. J. Böhlan, he visited Lesbos and the environs of Smyrna, and in the latter he believes he has found a suitable spot for excavations. This is the ancient city of Larissa, on the lower part of the river Hermos, where he believes is one of the earliest cradles of the culture which yielded us the songs of Sappho and Alkaio, and indirectly even the Iliad. The Sultan has been asked for a concession, which it is hoped may be obtained in time for the work to be commenced in the spring.

The new English Church at Valescure has been enriched by the gift of a brass lectern designed in the Byzantine style to harmonise with the surroundings of the church. The lectern, which stands about 5ft. high, is ornamented with acanthus flowers in Byzantine detail, and its colour is dead Roman gold, exactly as the metal is left by the workers' tools, and thus changes of climate do not affect it. The stem is ornamented with four onyx stones.

Monmouth Castle.—The Duke of Beaufort has decided to sell his Monmouthshire seat, the celebrated Troy House, and when it is put up for auction in the spring a large amount of his property in that county will also be offered. The property to be offered will include the ruins of Monmouth Castle and the Tower House, which is at present leased to the War Office. Monmouth Castle is famous for having been the seat of John of Gaunt, while Troy House contains the cradle in which Henry V. was rocked, and a suit of armour which he wore at the Battle of Agincourt.

The Restoration of Pierrefonds was a notion of the Empress Eugénie, who wanted "to bring a chapter of Walter Scott into her life." The idea occurred to her at a picnic, and as it haunted her she consulted M. Viollet le Duc at one of her Compiègne teas. He entered into her views. The Directors of State Buildings and of Fine Arts did so too. The Empress wanted to find a change at Pierrefonds from the unpicturesque classicality of Compiègne. The architect worked wonders. The castle he restored is now a mediæval museum, and a most interesting place to visit. The most numerous tourists attracted by it are Germans.

Workmen's Dwellings for Llandudno.—A Local Government Board enquiry was held recently into the applications of the Llandudno Urban Council for permission to obtain a number of loans for various purposes. The first application was for a loan of £6,367 for the erection of workmen's dwellings of 32 lettings and 28 houses, which would be divided into four classes at a rental of 7s., 5s. 9d., 5s., and 3s. per week each, including rates and taxes:—Class A, composed of ten houses with a frontage of 18ft., with living room, kitchen, larder, scullery and washhouse, three bedrooms first floor, bathroom and attic bedroom, there being attached to each an open space of 293ft., asphalted; Class B, of which there were eight houses, composed of similar rooms with smaller dimensions; Class C, containing no bathrooms; and Class D, divided into flats. The next application was for a loan of £1,782 for water supply; this was explained to be a part of a scheme adopted by the Council in 1895 substituting 15-inch water mains. The application covered a length of 1,045 yards of 15in. main. A further application for £1,135 to cover cost of protection works for the extension of the sewer was also heard.

Walthamstow and William Morris.—Mr. Passmore Edwards has given to the Walthamstow Public Library a bust of the late William Morris, executed by Mr. Henry C. Fehr. The ceremony of unveiling the bust and of opening the extension of the lending library was performed last Saturday week by Mr. W. Holman Hunt. Mr. Holman Hunt, before unveiling the bust, gave an interesting address, in the course of which he bore warm testimony to the character, work, and genius of the late William Morris, and said Walthamstow had good reason to be proud of the fact that they could claim him as a native of the district. Commenting upon the lamentable decline in decorative art which began in the reign of George IV., he referred to the great efforts made by Benjamin Hayden to revive it, and then proceeded to deal with the earnest manner in which Morris took up the neglected art, brought it to a state of perfection, and made it by its very beauty commend itself to the public. Mr. Passmore Edwards said that it had been his pleasure to promote the establishment of public libraries, and he was now placing busts of local men in these libraries. He had placed medallions of Charles Lamb and Charles Keats in one library, and it was his intention to place those of Browning and Ruskin in Camberwell Library, and of Sir Edward Burne-Jones and Lord Leighton in another.

Mr. Horace Gundry, F.R.I.B.A., surveyor for Paddington, died last Friday week, aged 59 years.

St. George's Cathedral, Cape Town is to be replaced by a larger and more imposing building. Towards the erection Mr. Cecil Rhodes has promised £3,000 "as a war memorial."

"Builders' Journals" Wanted.—The publisher will be glad to send a copy of the current number of the "Architectural Review" in exchange for any three copies of the "Builders' Journal" for the following dates:—April 19th, June 28th, and November 1st, 1899; and January 17th, 1900.

The Death is announced of Mr. Gabriel Carelli.—Born in 1821 in Naples of a family of many generations of artists, he had reached his eightieth year, yet he only laid down his brush two days before his death. Street scenes and fine architectural subjects of interiors and exteriors are among his most noteworthy productions, in Italy, Spain, Constantinople and the East.

Victoria Street, Westminster, will soon have changed its character. Half a dozen new shops are ready for opening. Others are to be constructed, and in many windows of the stately buildings that line the thoroughfare bills are displayed announcing the readiness of landlords to convert the premises into places of business. Victoria Street when first built was regarded as an architectural triumph.

The Professorships in the Royal College of Art recently made at South Kensington mark emphatically the changes that have been brought about there under the scheme of reorganisation. Mr. Gerald Moira becomes Professor of Painting, Mr. Lethaby Professor of Design, Mr. Beresford Pite Professor of Architecture, and M. Lantèri retains the Professorship of Sculpture. Under the old system the school scarcely justified its existence.

The Grand Theatre, Islington.—The re-building of this theatre, since the fire which occurred there in March last, has now been completed. Mr. Frank Matcham was the architect, and Messrs. Dearing & Sons were the contractors. Although rebuilt on the original lines as to the auditorium, great additions have been made in the way of extra exits, and it is computed that the house could be emptied in about one minute in the event of fire or panic. A fire-curtain has been added to the stage.

Competition for Police Courts and Fire Station at Blackburn.—It was announced on page 396 of our last issue that the authors of the accepted design in this competition were Messrs. Briggs & Wolstenholme and Messrs. Stones & Stones, both of Blackburn. Mr. A. N. Bromley, of Nottingham, was the assessor. The probable cost of the buildings is worked out as follows:—

	Cubic feet.	£	s.	d.
Police courts, main block ..	530,000 @ 10d.	22,083	6	8
" police quarters	172,000 @ 6½d.	4,658	6	8
Fire station, engine house ..	118,000 @ 6d.	2,950	0	0
Fire superintendent's house, two houses at Duke Street end, stables, recreation rooms, &c.....	178,000 @ 6½d.	4,820	16	8
Hose tower	16,000 @ 1s.	800	0	0
17 firemen's cottages	@ £200 each	3,740	0	0
Paving, drainage, &c.		1,100	0	0
Total estimated cost.....		£40,152	10	0

Vandalism in Asia Minor.—The ruins of the ancient Ionian city of Magnesia, on the river Mæander, near Miletus, which were laid open by the German Professors Karl Humann and Baron Hiller, about a decade ago, have since been partially demolished by the head architect of the Turkish Province of Smyrna. This man, says a correspondent of the "Standard," is a Polish engineer named Baronovski. In 1895 he had the Temple of Zeus pulled down, and used the large marble stones for the construction of a mosque at Smyrna and of a bridge over the Mæander. He would have continued his work of destruction then had not Dr. Wiegand, in charge of the German excavations, telegraphed to Kiamil Pasha, Governor-General of the province—well known for the interest he takes in antiquities—to prohibit the operation. It is to be hoped that Baronovski will now be stopped, once for all, from continuing his vandalism.

New Companies.

Park Cottage Company, Limited.

This company was registered on December 5th with a capital of £7,500 in £10 shares to acquire land and buildings, to erect dwelling-houses, cottages, and other buildings, and to carry on the business of auctioneers, surveyors, land, house, and estate agents, financiers, contractors, builders' merchants, &c. Registered office: Ffrwd Offices, Mountain Ash, Glamorganshire.

East Coast Saw Mills Company, Limited.

This company was registered on December 7th with a capital of £10,000 in £1 shares to acquire the business carried on at Hull, Scarborough, Birmingham, and elsewhere as the East Coast Sawmills Company, and to carry on the business of timber merchants, sawmill proprietors, timber growers, and importers, manufacturers of all articles in which timber or wood is used, &c. The first directors (to number not less than three nor more than seven) are F. Bedwell, T. J. Baker, T. Brown, and W. James.

Commonwealth Portland Cement Company, Ltd.

This company was registered on December 4th with a capital of £100,000 in £1 shares to acquire certain property at Ivanhoe, Roxburgh, New South Wales, to adopt an agreement with the New Zealand Mines Trust, Limited, and to carry on the business of cement and brick manufacturers, limestone, lime, shale, sand, earth, metal, and mineral merchants, quarry-owners, engineers, &c., as miners, mine-owners, colliery-owners, coal-merchants, brick and lime burners, brick and tile makers, &c. The first directors (to number not less than three nor more than seven) are T. Russell, C.M.G., H. T. Bristow, C. E. Russell, and W. T. Dodds.

COMING EVENTS.

Thursday, December 27.

ROYAL INSTITUTION.—Sir Robert Stawell Ball on "Great Chapters from the Book of Nature."—I., 3 p.m.

Friday, December 28.

LONDON INSTITUTION.—Professor W. B. Bottomley, M.A., F.L.S., on "Flowers: I.—Structure and Colour," 4 p.m.

Saturday, December 29.

ROYAL INSTITUTION.—Sir Robert Stawell Ball on "Great Chapters from the Book of Nature."—II., 3 p.m.

Monday, December 31.

LONDON INSTITUTION.—Professor W. B. Bottomley, M.A., F.L.S., on "Flowers: II.—Insect Visitors," 4 p.m.

Tuesday, January 1.

ROYAL INSTITUTION.—Sir Robert Stawell Ball on "Great Chapters from the Book of Nature."—III., 3 p.m.

Thursday, January 3.

ROYAL INSTITUTION.—Sir Robert Stawell Ball on "Great Chapters from the Book of Nature."—IV., 3 p.m.

LONDON INSTITUTION.—Professor W. B. Bottomley, M.A., F.L.S., on "Flowers: III.—Unbidden Guests," 4 p.m.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.—Mr. W. B. Esson, M.I.C.E., M.I.E.E., on "The Case of Electric Power Distribution," 8 p.m.

TENDERS.

Information from accredited sources should be sent to "The Editor." Results of tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the Work.

BASFORD, Notts.—For additions to hospital for the Guardians. Mr. W. V. Betts, architect, Radford Road, Old Basford:—

W. C. Shaw	£1,942 0 0	W. J. Hutchinson	£1,689 15 6
J. Greenwood ...	1,820 0 0	A. B. Clarke	1,687 12 4
J. Cooper	1,745 0 0	W. Maule	1,664 0 0
J. G. Thomas ...	1,737 0 0	G. Hopewell & Son,	
J. Attenborough...	1,700 0 0	Old Basford * ...	1,650 0 0

* Accepted.

DARTFORD.—For the erection of an electric-light station, for the Urban District Council. Messrs. Hesketh & Stokes, architects, 110 Cheapside, E.C.:—

T. Martin	£8,043	Perry Bros.	£5,807
Leslie & Co., Ltd.	6,587	Smith & Sons, Ltd. ...	5,619
J. Lonsdale	5,935	Somerford & Son * ...	4,906

* Accepted.

DONCASTER.—For the erection of schools and house, Owston, for the Owston and Skellow School Board. Mr. J. Simmons, architect. Quantities by architect:—

Sprakes & Sons	£2,053	G. Mottram, Queen's	
Gill & Son	1,877	Road, Doncaster * ...	£1,750
Arnold & Son	1,780		

* Accepted.

HANDSWORTH, Staffs.—For making up Hutton Road for the Urban District Council. Mr. H. Richardson, C.E., Council House, Handsworth:—

J. Biggs	£2,424 0 0	Fitzmaurice & Co.	£2,243 0 0
G. Law	2,249 0 0	J. White, jun. ...	1,976 15 0
Currall, Lewis & Martin	2,246 0 0	G. Trentham, Handsworth *...	1,848 0 0

* Accepted.

LONDON, S.E.—Accepted for the rebuilding of shop and premises, No. 901 Old Kent Road, S.E., for Mrs. M. A. Chalk, Caterham, Surrey. Mr. J. Halsted-Waterworth, architect and surveyor, 281A Queen's Road, New Cross Gate, S.E.:—

Sydney R. Best, Brockley £915 15 0

LONDON, S.E.—Accepted for reinstating damage by fire to stable and chaff-cutting room at the rear of No. 94 Borough Road, S.E., for Messrs. Charlesworth & Austin, Ltd., High Street, Borough, S.E. Mr. J. Halsted-Waterworth, architect and surveyor, 281A Queen's Road, New Cross Gate, S.E.:—

H. M. Dobson, New Cross Gate £90

LONDON, S.E.—Accepted for additions and alterations at Nos. 51, 53, 55 & 57 Commercial Road, Peckham, S.E. Mr. A. E. Mullins, architect and surveyor, 16 Church Street, Camberwell Green, S.E.:—

J. H. Thompson £720

LONDON, S.E.—For rebuilding No. 77 Warham Street, Kennington, S.E., for Mr. G. Moss. Mr. A. E. Mullins, architect and surveyor, 16 Church Street, Camberwell Green, S.E.:—

G. Wood & Co.	£289	H. & G. Mallett	£280
Rice & Son	285	J. Gedye*	257

* Accepted.

LONDON, N.—Accepted for the completion of four cottages in Montagu Road, Edmonton, N., for Mr. B. S. Dimmock. Mr. A. E. Mullins, architect and surveyor, 16 Church Street, Camberwell Green, S.E.:—

A. Mitchell £473 12 6

LONDON, W.C.—For alterations, &c., at Nos. 67 and 71 Russell Square, Bloomsbury, W.C., for the National Union of Teachers. Mr. A. E. Mullins, architect and surveyor, 16 Church Street, Camberwell Green, S.E.:—

Cox	£753	Philps & Bisiker	£650
Burman & Sons	692	Lee	648
Marsland	676	Smith*	617

* Accepted.

LONDON, S.E.—Accepted for the execution of repairs, &c., at Relief Station, Peckham Park Road, S.E., for the Camberwell Guardians. Mr. A. E. Mullins, architect and surveyor, 16 Church Street, Camberwell Green, S.E.:—

W. Wright £165 2 3

LONDON.—For taking down and rebuilding the Dundee Arms Hotel, Artillery Street, Bermondsey, for Messrs. Noakes & Co., Limited. Mr. G. W. Thompson, architect. Quantities by Mr. C. A. Priestley, 35 Norfolk Street:—

		Extra for granite.	Total.
Bullers	£10,400	£500 0 0	£10,900 0 0
Laurance & Sons ...	9,046	—	—
Rider & Sons	8,669	500 0 0	9,169 0 0
Patman & Fothering-ham...	8,111	482 0 0	8,593 0 0
Downs	7,893	510 0 0	8,403 0 0
Lole & Lightfoot	7,859	466 0 0	8,325 0 0
G. Newton*	7,649	453 5 6	8,102 5 6

* Accepted.

LONDON.—For the erection of new drying and stamp rooms, for the Vinolia Company, Limited, Stratford. Mr. S. S. Dottridge, architect, Albert Buildings, Queen Victoria Street, E.C. Quantities by Mr. F. R. Smith, 6 Great College Street, Westminster:—

Gregar & Sons	£2,888	Weibking & Son	£2,685
Falkner & Sons	2,781	Munday & Son * ...	2,603
Outhwaite & Son	2,726		

* Accepted.

LONDON.—For the erection of a receiving-house for children and nurses' home, Broad Street, W.C., for the Guardians of the Poor of St. Giles-in-the-Fields and St. George, Bloomsbury. Mr. J. Grafton Izard, architect, 5 Bloomsbury Square, W.C. Quantities by Messrs. Gardiner & Theobald, 110 Great Russell Street, W.C.:—

F. & H. F. Higgs	£14,150	King & Son	£12,200
T. C Sharpington ...	13,750	H. L. Holloway	12,000
Foster Bros.	13,539	W. J. Renshaw	11,989
Courtney & Fairbairn	13,221	Smith & Sons...	11,892
Todd & Co.	13,069	J. Appleby	11,890
Hibberd Bros., Ltd. ...	13,068	Prestige & Co.	11,777
B. E. Nightingale... ...	12,555	A. Bush, 64 Ridgmount	
C. Ansell	12,527	Street, W.C.* ...	11,586
H. Wall & Co....	12,292		

* Accepted.

[Architect's estimate, £12,114.]

LONDON.—For electric lighting, Grove Park Workhouse. Mr. Thomas Dinwiddy, architect, 54 Parliament Street, S.W., and Greenwich:—

Pearson & Co.	£7,550	Samuel G. Cozens... ...	£6,140
Troy & Co....	7,394	Collins Bros	5,921
National Electric Wiring Co.	7,350	Foote & Milne	5,763
Hampton & Sons	6,598	Johnson & Phillips ...	5,550
Barlow Bros. & Co. ...	6,400	Joel & Co.	5,456
Drake & Gorham	6,380	Dawson & Co.	5,014
Geipel & Lange	6,278	Lea & Warren	4,910
		Cook & Co.	4,338

* Accepted. [Architect's estimate, £5,500.]

NEWMARKET.—For the erection of engine and destructor houses, &c., Exning Road, for the Urban District Council:—

CONTRACTS OPEN.

THE URBAN DISTRICT COUNCIL of WHITBY.

BUILDINGS FOR ELECTRIC LIGHT STATION.

The Urban District Council of Whitby are prepared to receive TENDERS for the ERECTION of an ELECTRIC LIGHT STATION and DESTRUCTOR.

General conditions, form of Tender, and bills of quantities can be obtained on and after TUESDAY, 1st JANUARY, 1901, and drawings can be inspected on application to the Clerk at the Offices of the Council, Whitby.

Tenders upon printed forms, and endorsed "Electric Light Station," to be delivered at the Offices of the Council not later than TWO o'clock on TUESDAY, the 8th JANUARY, 1901.

£10 to be enclosed with each Tender, which will be returned to all unsuccessful contractors immediately Tenders are accepted.

The Council do not bind themselves to accept the lowest or any Tender.

By order,
WM. SEATON GRAY,
Clerk to the Council.

Offices,
Whitby, Yorks.

ROCHFORD RURAL DISTRICT COUNCIL.

TO BUILDERS.

The Council invite TENDERS for the ERECTION of an ISOLATION HOSPITAL near Sutton Ford Bridge, Rochford, Essex.

Plans and specification may be seen at the Offices of the Architects, Messrs. C. & W. H. PERTWEE, Chelmsford, or of the Quantity Surveyors, Messrs. R. L. CURTIS & SON 119 and 120 London Wall, London, E.C.

Bills of quantities and form of Tender may be obtained from the Quantity Surveyors on payment of £1 1s., which sum will be returned on receipt of a bonâ-fide Tender.

Tenders are to be sent to me not later than MONDAY, the 7th JANUARY next.

The Council do not hold themselves responsible for the accuracy of the quantities, or bind themselves to accept the lowest or any Tender.

By order,
FREDERIC GREGSON,
Clerk.

Southend-on-Sea,
December 1900.

PARKER

"Lucky Curve"
Fountain Pen

MAKES AN IDEAL
CHRISTMAS PRESENT.

PEACE AND THE **PARKER JOINTLESS FOUNTAIN PENS**

Go hand in hand. **If you** want pen-peace, the smooth, swift, simple Parker will give it. It has neither screw joint or nozzle, but a perfectly smooth barrel from tip to tip, making it

Jointless.

The secret of its simplicity and perfection is the famous **"Lucky Curve,"** Combined with our new **Spring Lock Device.** Also fitted with our **Anti-Break** Cap. Ask your dealer to let you try a Parker. Now and then a dealer tries to sell an old-style pen instead; in such a case write us. If you want to investigate send for our valuable Guarantee and interesting Booklet, Free.

Or if you need a pen at once our No. 020, **Price 10/6,** offers extraordinary value; and our *Gravity Style* at **3/6** is the best in the World. Sent by post on receipt of price if your dealer will not supply you.

THE BUILDERS' JOURNAL & ARCHITECTURAL RECORD

JANUARY 2, 1901. No. CCCVIII.

EFFINGHAM HOUSE, ARUNDEL STREET, STRAND, W.C.

An Architectural Causerie.

The Past Year. ARCHITECTURE is not a thing subject to violent changes—its advance or retreat is not the work of a day, or a year—and it becomes difficult for a contemporary writer to discern the direction and force of the current in thought and handiwork. Though the present state of architecture is very far from satisfactory, still there is a steady, though slow, movement towards a better standard, in spite of the fact that the commercial requirements of to-day are so antagonistic to everything outside their own category. During the past century England has witnessed a great vacillation among her architects, first the old Classic of Chambers and his school, then the Neo-Greek of Decimus Burton, later the enthusiastic revival of Gothic architecture, and at the present time a medley of styles, some following Renaissance models, others feebly copying the Gothic revivalists, and a small—growing—body of earnest workers striving amid the hubbub to found a style intrinsically belonging to their own day, a body of men using their materials in an honest skilful way, simply, effectively and with frank purpose; and these men are the centre of a great hope—may it be fulfilled! Perhaps the chief architectural event of 1900 was the competition for the buildings on the crescent portion of the new street from Holborn to the Strand. We have already criticised the eight sets of designs which were sent in: suffice it to say now that, while several were very meritorious, not one embodied the great civic idea, and all showed a lack of that grouping of mass so essential to the appearance of large blocks of buildings and so ably represented in the works of some of the great French architects. The conditions imposed by the London County Council were not fair to the competing architects, and now that the designs by Mr. Runtz for the Gaiety Theatre and a block of buildings adjoining have been passed by the Strand Improvement Committee it seems that the idea of a homogeneous treatment has been abandoned. Mr. Norman Shaw's criticism of the designs is still kept secret, though for what reason it is hard to say. It is to be hoped that the Council will not throw over the idea which prompted them to hold the competition, as they will thus miss the great opportunity which is at present theirs. During the past year several other large competitions have been decided, prominent among which were those for the new Sessions House in the Old Bailey and the Mersey Docks and Harbour Board Offices—the latter being limited to Liverpool architects. Mr. Mountford's building for the Sessions House should look very fine when erected. A great deal of attention has been drawn to the problem of housing the poor and many attempts to solve it have been made throughout the kingdom—at London, Liverpool, Birmingham, Edinburgh, Manchester, Bradford, Dublin. In some cases considerable success has been achieved and a great many insanitary areas have been swept away, but with the present conditions of the tenure of land and the high prices of materials and labour it is generally found impracticable to let the new houses at rentals sufficiently low to allow the very poor to live in them. As might be supposed, the problem in London has assumed an alarming aspect, though the Council has latterly pursued a most energetic course, with much success. In March last the Prince of Wales opened the last block of buildings on the Boundary Street area and it is only necessary to learn the facts about this former plague spot in order to appreciate the great difficulties that have to be encountered. The buildings on this area, by Mr. Blashill and Mr. Rowland Plumbe, and also those on the Millbank estate, show what can be done even when all expenses are cut down to a minimum. During 1900 the prices of materials continued to rise, and this has largely affected building operations, while the phenomenally high price of coal has seriously hampered brickmakers, who are vainly looking around for a new fuel. Almost a year ago John Ruskin died, within three weeks of his eighty-first birthday. As Mr. E. T. Cook expressed it, Ruskin's principal work in art criticism was done fifty years ago, and done so completely that the new generation had forgotten it—the very depth and diffusion of his influence on the artistic world blinded his later contemporaries to its magnitude. Now the eloquent voice is silent, and Ruskin lies in the quiet churchyard of Coniston, amid the mountains that were his home and his daily delight; but his influence lives and is bearing much fruit. William Butterfield, that noble builder in brick, that kindly gentleman, that able architect; William Young, the author of the new War Office design and the architect of the municipal buildings at Glasgow; Charles Barry, the son of the late Sir Charles Barry; and Henry Currey, the architect of St. Thomas's Hospital—these four names must be included in the list of deaths for 1900. During the past year many large buildings have been begun or completed. In London the sites have been cleared for the new Government buildings in Whitehall, the work of completing South Kensington Museum according to Mr. Aston Webb's design has been commenced, and the new Royal College of Science and Royal School of Art Needlework, both in the vicinity, have been begun; the new Roman Catholic Cathedral at Westminster (J. F. Bentley, architect) is approaching completion; large new hospitals have been built at Ladywell, Lewisham, Hendon and Bethnal Green; Marylebone Workhouse and the Italian Hospital have been extended; three big office buildings have been finished on the Victoria Embankment; the Hippodrome and the Hotel Russell have been opened; Spurgeon's Tabernacle has been reconstructed; and considerable progress has been made with the Eastern Telegraph Company's building in Finsbury Circus and with Mr. Alfred Waterhouse's extensions to the Prudential Assurance Company's premises on Holborn. It is impossible to enumerate the buildings that have been completed in the provinces; a few, however, of the larger works may be mentioned. At Newcastle the City Lunatic Asylum has been enlarged; at Nottingham an immense new station has been built; at Glasgow a new central fire station and the Ruchill Hospital were opened; new Physical Laboratory to the Owen's College at Manchester; large new workhouse at Doncaster; new municipal buildings at Chatham and Douglas; new

CORNER-POST, SILENT STREET, IPSWICH. DRAWN BY EDWARD WALKER.

Sessions house at Preston; extensions to the Alexandra College at Dublin; new art gallery at Bath; Colston Hall reconstructed at Bristol; workmen's dwellings at Birmingham; and a large new church at Eccleston from designs by Mr. Bodley. The past year has not been without its acts of vandalism, the greatest of which was perhaps the erection of the new guard-house at the Tower, a red-brick building entirely out of keeping with the weathered stone buildings of London's ancient fortress. It is to be hoped that the Government will not abuse its trust in the keeping of Tintern Abbey. The most notable books relating to architecture published during 1900 were:—"Gothic Art in England" (Prior); "The Art and Craft of Garden Making" (Mawson); "French Architects and Sculptors of the Eighteenth Century" (Lady Dilke); "Old Cottages and Farm Houses in Kent and Sussex" (Davie and Dawber); "Later Renaissance Architecture in England" (Belcher and Macartney); "Royal Tombs of the First Dynasty" (Flinders Petrie); "Pompeii" (Mau); and "Homes for the Working Classes in Urban Districts" (Cranfield and Potter). In January last the scheme for the Homes of Rest at Bisley for discharged soldiers, which form the Building Trades' Gift to the Nation, was promoted. The Central London Railway was opened in June; the cement manufacturers and the wallpaper manufacturers formed two large "combines"; and much attention was drawn to the questions of public competitions and architectural education, and to the decoration of St. Paul's Cathedral. These are a few of the things which might be mentioned as having taken place during 1900. Many other items of importance could of course be spoken of, but space forbids; nevertheless, enough has been said to show that both the principles and practice of architecture are being followed with earnestness and zeal; let us hope that the new century will witness the rise of a great national style developed by a great race of architects.

THE OLD NEPTUNE, IPSWICH.

IPSWICH.

BY EDWARD WALKER.

LIKE many other towns and cities of England, the ancient borough of Ipswich, the county town of Suffolk, has, during the last half-century, been slowly but surely losing its mediæval character, and this has been brought about, here as in the majority of other similar places, by the growth of the town as a centre of commercial industry. One or other of those narrow ancient streets, once lined on either side by the dwellings of the merchant princes, each with its overhanging upper storey, its many-paned windows and quaint gables, has from time to time been found to be quite inadequate for the ever-increasing traffic, and the result has been that in the subsequent alterations many buildings of very great interest and beauty have been swept away. Happily for the architectural student, however, a considerable number of similarly ancient houses still remain, silent witnesses of a former grandeur. Many now serve as warehouses; others have been converted into inns. In some of these latter it is quite a common sight nowadays to see the labourer taking his small beer seated on a richly-carved settle, amidst such surroundings as oak-panelling and an almost gorgeous mantelpiece can give, to say nothing of, maybe, a fine coffered ceiling moulded into curious devices of a most beautiful character. A few of these old abodes are still occupied as dwellings, but these are for the most part tenanted by people in very different circumstances from those enjoyed by the former habitants.

The architectural antiquities of Ipswich are of a domestic rather than of an ecclesiastical or baronial character. There are neither remains of a castle nor ruins of an abbey, but the place was formerly encompassed by gates, earthworks and ditches, of which, however, there are now only few traces. The ancient churches of the town have in most instances been replaced by modern structures, but those old edifices which still exist afford subjects of much interest to the student. They are for the most part of flint and freestone or rubble, the towers of some of those of a later date being of extreme value as examples of the decorative treatment of these materials. That illustrated in the accompanying drawing of "Sparrowe's House" may be taken as a typical instance of a tower of this description. The plain surface of the stone walls is relieved by means of squares, circles and diamonds in flint running in horizontal bands, and this, though doubtless often at the sacrifice of simplicity, gives to these towers an extremely rich and brilliant effect, seen to best advantage in bright sunshine. Much of the internal beauty of these old Ipswich churches is due to their open timber roofs, of which there are one or two fine specimens, particularly that of St. Margaret's, a well-designed hammer-beam, the timbers richly ornamented with carved shields and scroll-work. This church is Early Perpendicular, and possesses a finely-traceried clerestory with an elaborate battlement, while in the interior are a good fourteenth-century octagonal font and interesting remains of a rood staircase.

It has been said that there still remain in Ipswich some interesting examples of domestic architecture of the fifteenth and sixteenth centuries, and undoubtedly the finest of these is "Sparrowe's," otherwise "the Ancient," house. This house is not merely a remarkable instance of elaborate ornamental pargeting, but the details of its ornamentation are so curious as to be almost unique—perhaps they are as quaint as those of any dwelling in England. The exterior and interior are of different periods, and the whole has been subjected to many alterations; in fact, the house in its present state is the accumulated product of a series of years extending over two centuries. In the year 1801 a secret room was

discovered at the top of the house, over one of the attics. It had a good fifteenth-century hammer-beam roof with carved angels and corbel heads, and (being the oldest portion of the house) it is probable that it covered a hall which at a later date was subdivided into the smaller rooms still to be seen. Many of the rooms are elaborately panelled, one of those at the front being enriched by a beautifully-carved mantelpiece with the arms of the Sparrowe family conspicuous among the details. Our illustration shows the corner of the house overlooking a narrow lane, but the principal façade, 70 feet in length, faces the main street, and consists of four bays of a similar character to the one illustrated. Along the basement storey, on brackets, panels and cornice, are strings of pendent fruit and other floral decorations, cleverly moulded in plaster. On the first floor, in a central position, are the royal arms of Charles II., and on the base of each of the four oriel windows modelled figure subjects emblematical of the four continents—Europe, Asia, Africa and America. Between the windows, and springing from a moulded pedestal, are pilasters, across each of which hang large festoons of fruit and flowers, while the whole is surmounted by a heavy cornice extending the length of the front. The sky-line of the roof is picturesquely broken by four quaint dormers, and in the triangular space over the casements are figures of Cupids in various postures modelled in somewhat high relief.

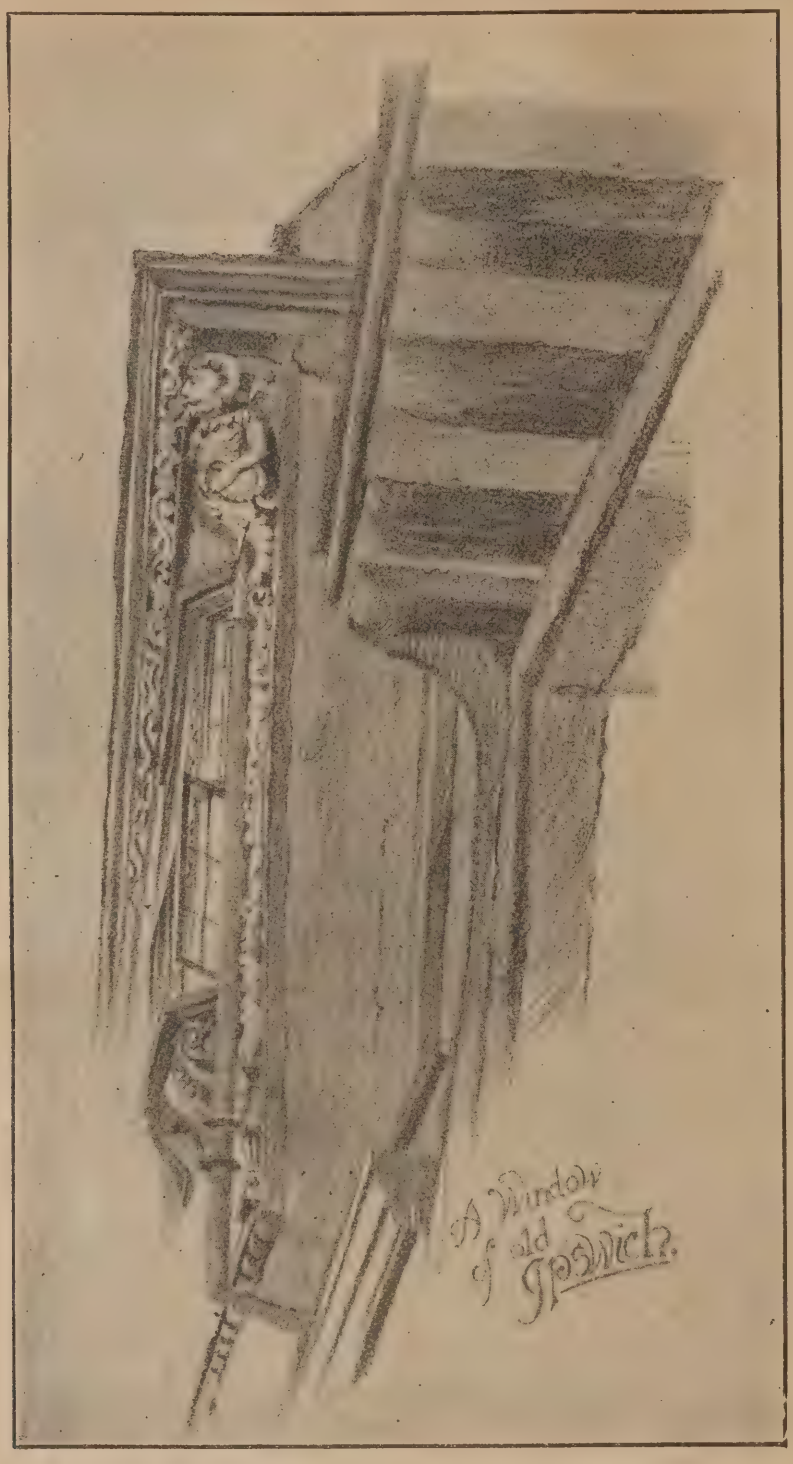
Though there are several fine old houses in other parts of the town, yet, as one would expect, most of them are to be found in the neighbourhood of the harbour side. It was here that the bold pioneers of trade dwelt, the front of the house being to the street, with the warehouses in the rear overlooking the river. The "Old Neptune" Inn and the "Lion and Lamb," forming the subjects of two of the accompanying illustrations, were formerly the residences of some of these merchant-adventurers, and with their picturesque oriels, their carved window-frames, door spandrels and eaves-boards, their panelled rooms and moulded ceilings, give us a good idea of the pride these men took in their homes.

It is not possible now to enter into any detailed description of the Elizabethan mansion of Christchurch, the "Wolsey Gate," the old Ipswich corner-posts, and many other of the antiquities of Ipswich, yet the student may be assured that a visit to this old town will not only be extremely gratifying to him, but (which is more important) instructive also in the highest degree.

LIGHTNING CONDUCTORS.

BY C. E. SAVERY.

DURING the last few decades electricity has so far developed itself in the various uses to which it can be adapted, providing for the transmission of messages from one end of the world to the other, in the lighting of our streets and dwellings, or in the carrying of goods and passengers—that very little attention is paid at the present time to the electricity generated by the elements themselves; and it is only occasional accidents which serve to remind us of the existence of a power in the air to which we appear to have become accustomed. It seems a paradox that we should use electricity for so many useful purposes and yet be unable to gauge with any degree of certainty the effect of a single lightning flash in the sky. From the time when Franklin flew his son's kite and drew off the electric fluid by means of a key attached to the string until the present the imperative necessity for lightning conductors for preventing accidents to buildings is generally admitted. How frequently, however, do these fail to act with any degree of certainty when a building unfortunately happens to be struck. Provision should be made so that the fluid may be conveyed to the earth with as little danger to the fabric as possible; yet it certainly seems that an unpleasant element of chance obtrudes itself into the case. In too many instances of recent accidents the electric fluid has partly traversed the conductor and then at a lower level been able to effect a considerable amount of damage; at other times the conductor has been conveniently ignored by the flash, and injury otherwise inflicted. Of course it will be said that numerous cases occur, of which we have no record, where buildings were actually struck and the fluid has been safely carried away by the conductors; and this may happen quite frequently. Granted. But the fact remains, that too many accidents occur where lightning rods



are fixed for us to admit that their working is entirely satisfactory. Unless an unforeseen accident happens to the conductor itself our buildings should enjoy comparative immunity from the effects of thunderstorms, and we may therefore be led to a consideration as to some of the causes which lead to the accidents in question.

At the present time it has become the fashion to leave matters requiring special treatment to experts in the different branches of science. This has undoubtedly many advantages, but on the other hand the younger branch of the architectural profession is apt to leave troublesome matters, such as the details pertaining to lightning conductors, to an expert in this special line of work. Admittedly we live in an age of specialists in every department of science and art, and it cannot be denied that those who devote all their energies to one particular branch (or more) must acquire greater knowledge on these special subjects than an "all-round man" could possess; yet this system of delegation, so to speak, is not altogether right. It leads frequently to a slipshod method of specification, not confined, unfortunately, to lightning conductors, with a resultant liability to accident occurring to the building itself for which the architect alone is primarily responsible.

Some general remarks may here be made with regard to the causes for the apparent inability to deal with so important a matter as the safeguarding of a building against electric disturbances, and we may at once direct our attention to a few of these causes.

A reference to old forms of lightning conductors will show us that a copper chain was generally used for the conductor itself, and this practice has more or less survived. I say "more or less" because some experts now insist that an iron rod—or other material—is just as good a conductor as a copper cable. This may

ORIEL WINDOW FROM AN OLD HOUSE IN FORE STREET, IPSWICH.

be so, but, irrespective of its power of electric attraction, may not the copper itself present a better material for withstanding the effects of weather? Apart, however, from this, the chief point on which scientists disagree is the insulation or *not* of the conductor. Which is the best way to safely dispose of it? The old method was simply to carry the conductor into the earth by means of a coil of wire, and so disperse the electric force. Another method, now much advocated, is to connect the rod with a water-course or drain, where the fluid would be absorbed, or at any rate cease to be capable of doing any damage. In the former treatment the earth around the conductor should be kept as moist as possible, and the use of coke has been advocated for this purpose. In the writer's opinion, however, it seems that both methods work fairly satisfactorily, when the fluid has been safely brought so far, but it is rather in its transit over the conductor—after actual contact—that the chief difficulty presents itself. In many cases the lightning strikes the top of the rod, traverses it for some distance, and then diverges on to the fabric itself, causing considerable damage. It is, of course, well known that the electric flash is proverbially erratic in its course, but the means provided for its safe transmission to the earth should at least be arranged as simple and direct as possible. Some, indeed, urge that it is absolutely unnecessary to insulate the conductor at all, and that by following the line of the building, avoiding any unnecessary bends in the rod or cable, the fluid will pass safely to the earth. This, however, is shown by experience to be a very untrustworthy theory. In the case of a church spire or tower it frequently happens that a fairly clear fall exists to the earth from the point of contact, but often the conductor has to be carried past breaks of some sort—roof projections or perhaps a porch with an iron or metal guttering adjacent to the conductor—and this latter is quite as good an attraction for the fluid as the cable itself. The method advocated by some experts as to connecting the rod itself with all iron or metal work it may pass (so as to provide against any sudden distribution of the current in transit) seems hazardous. What is to guide the course of such extraneous electric fluid? It may, or may not, be safely conducted to earth or otherwise run an innocuous course. Here, then, risks occur which can and should be provided against. Again, it is often impossible to take the conductor directly to the ground, and it is instances such as these which call for special arrangements for the safe conduct of the electric force.

For the sake of argument, without questioning, therefore, the opinions of those who advocate non-insulation, it appears to the writer that such insulation becomes imperative when the cable has to be carried past other attractive objects likely to divert the electric fluid. This contention is chiefly based on the necessity for the complete insulation of telegraph and telephone wires. The conditions are, of course, very different—the force is not so erratic, to say nothing of the sudden impact to which the lightning conductor may at any time be subjected—yet there can be but little sense in the slipshod way in which many of the conductors of our large buildings are arranged.

The idea generally prevalent was that the fluid would only strike the highest part of a building, and for this reason the chimneys and other elevated portions of the fabric have very properly been the chief objects of care against attack. But so often has the fluid struck other parts of the fabric that it makes one wonder whether there is much use in the safeguards otherwise provided.

That carefully-arranged lightning conductors do actually protect the structure is readily proved by the immunity from accident of our tall chimney shafts, perhaps some hundreds of feet in height; it is comparatively seldom that these are damaged; and this strengthens the contention that a simple course for the conductor is necessary apart from complete insulation.

If, however, it is conceded that in the case of two conductors, the one simply attached to the building and the other insulated from it, the fluid will travel with equal ease over both, the point only remains as to whether the electric fluid could by any means escape from the insulated conductor whilst in transit to the earth. If this meets with a negative answer the result of the foregoing argument must undoubtedly be in favour of complete insulation. A powerful current passed over a large-sized model should tend to elucidate this—at any rate in so important a question nothing ought to be left to chance. It certainly rests with architects to see personally that their work is protected in the best possible manner from the effects of storm; and they are undoubtedly entitled to ask those who are specialists in these matters to provide some means for the adequate safety of their buildings.

THE EFFECTS OF HEAT AND COLD ON PLUMBER WORK.*

BY THOMAS HUME, F.I.S.E.

THE general effects of heat and cold on metals are familiar to most of us, and are of considerable interest. In the case of plumber work these effects are not so obvious, nor do they seem to most people to have anything like the same importance; indeed, till a comparatively recent time, they were considered as of such insignificance as to merit very little attention. This state of things, however, is rapidly passing away, as the changes that have taken place in connection with plumber work have rendered the effects of heat and cold more obvious; besides which there is the largely extended use of plumber work arising from our improved civilisation, and the important part it plays in securing the health and comfort of domestic life (I refer to the introduction of hot-water systems, high-pressure boilers, circulating tanks, &c.).

Effects arising from changes of temperature in the various departments of plumber work, varying almost from zero up to 212°

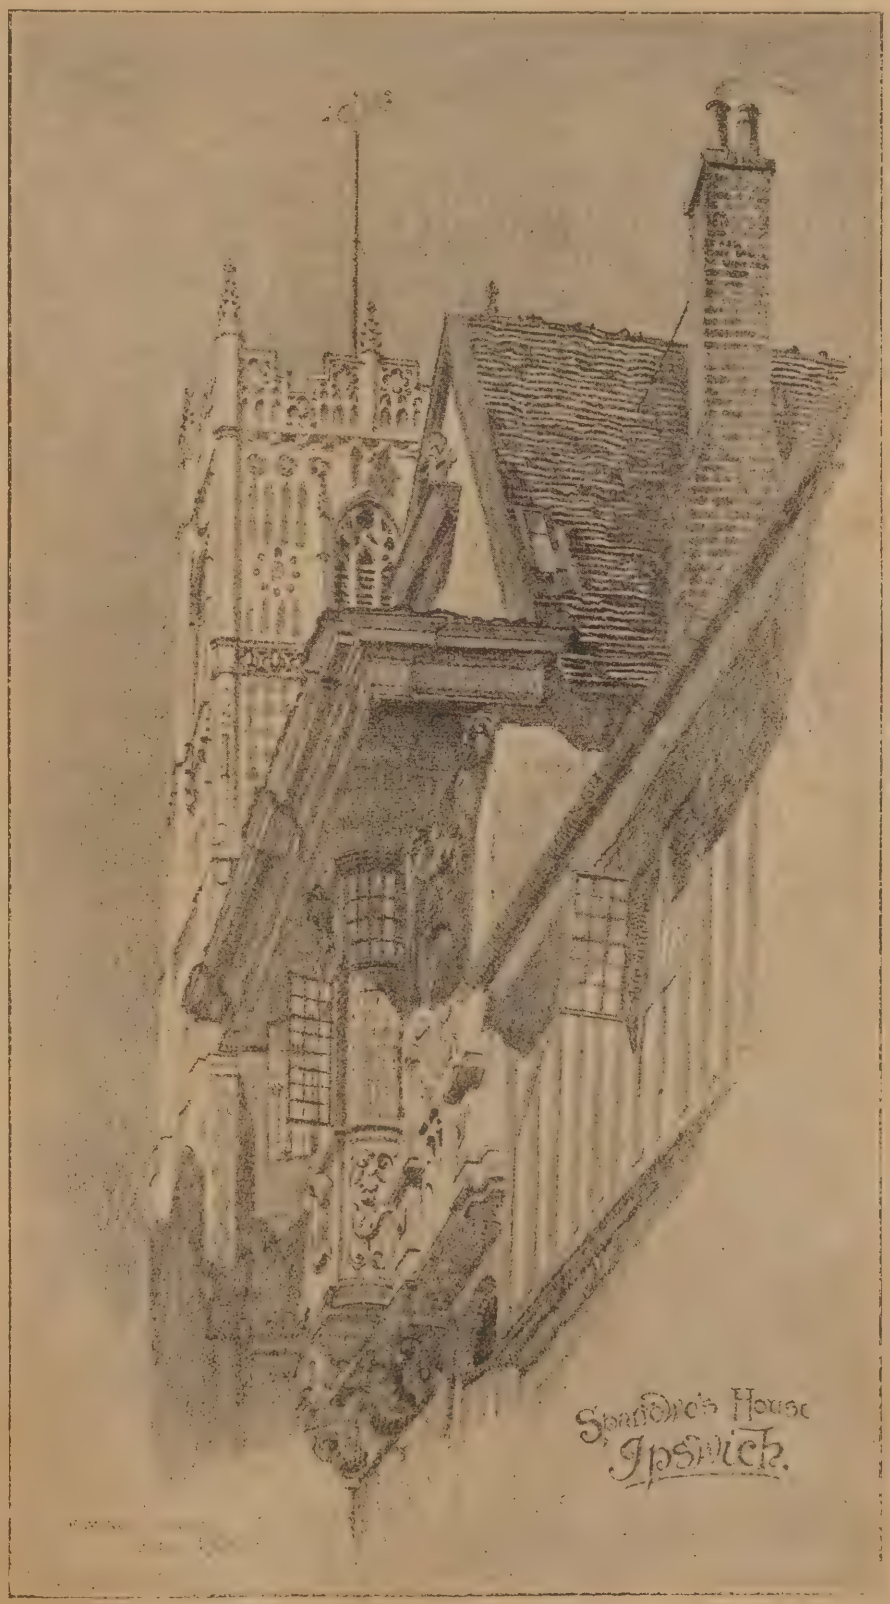
* A paper read before the Edinburgh Architectural Society on December 5th, 1900.

Fahr., have to be taken into consideration and provided for, otherwise the result will be most deleterious, for in nothing is the destructive work of time more evident than in the effects produced by the expansion and contraction of metals under these changes of temperature. As you are all doubtless aware, these effects are quite irresistible; there are no means that I have heard of whereby expansion and contraction under the influence of heat and cold can be prevented. If a piece of lead or other metal pipe is placed between two rigid obstructions (see Fig. 1) and heat applied, the pipe will either bend to one side in the middle (Fig. 2), or will swell out all round, to the extent of the expansion that takes place (Fig. 3); or if it is enclosed all round, as in the case of a hot-water pipe buried in the ground, the expansion will go inwards at some point and very soon produce a fracture (Fig. 4). This is due to one of those forces of nature that cannot be restrained. All that can be done is to provide for the natural law performing its functions with the least possible resistance, and thereby reducing its destructive effects to a minimum.

This has rendered necessary many changes in methods of construction, and the use of more suitable and stronger materials, which in turn have caused the plumbing trade to become an extremely complicated one. The working of lead was the original business of the plumber, and from this the name is derived, but by reason of the changes already referred to and to others of a commercial nature, other metals have been largely employed whose natures are entirely different, and require to be dealt with in quite a dissimilar manner. This I regard as a very trying experience in the trade, and one which, so far as I can judge, is not undergone in any other trade. The carpenter is never supposed to handle and shape any other material than wood; the mason, stone; the blacksmith, iron; but how different is it with the plumber, who, besides handling lead (which he fondly and with some pride regards as his chief metal), has to work zinc, copper, and block tin, and also to handle cast and wrought iron. The tendency must therefore be to cause a deterioration in the quality of the work produced; and hence the necessity for studying carefully and well the nature of the several metals, thus enabling the plumber to manipulate them in a manner calculated to give the best and most enduring results.

The effects of changes of temperature varying from 32 deg. to 212 deg. Fahr. on the metals I have named are very different, and bear the following proportions to the bulk of the materials:—

Lead	expands 1 part in		349
Zinc	"	"	322
Copper	"	"	581
Block tin	"	"	493
Wrought iron	"	"	846
Cast iron	"	"	901
Brass	"	"	584



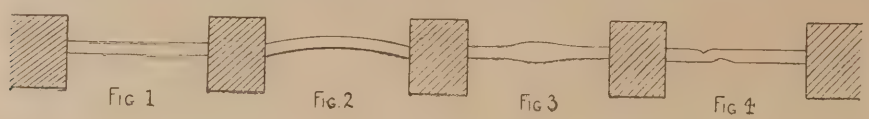
I have had a little apparatus made for the purpose of testing in a rough way the accuracy of the above table. It consists of a stand on which 1ft. of piping can be laid, one end of the pipe being stopped against a rigid obstruction, and the other end being free to expand; and in doing so under the application of heat it impinges upon the end of a lever, which moves an indicator over a quadrant-shaped dial. The results given on this apparatus, for the purpose of making them more apparent, are about double what they are in reality, because of the unequal lengths of the moving lever and indicator, and further because the experiments were made in a workshop where the temperature was 55 deg. to begin with. The heat was applied by means of a blow-lamp, with a thermometer lying inside the pipes.

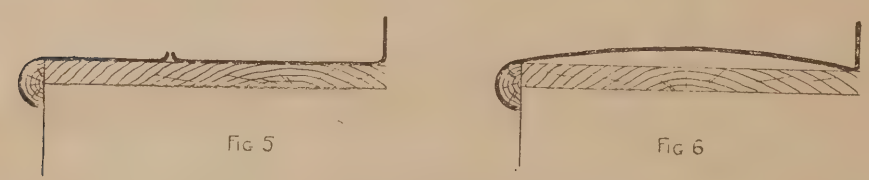
		Degrees.
1ft. of lead pipe	thus treated registered	3·0
Ditto copper	" "	1·9
Ditto galvanized wrought-iron	" "	1·5
Ditto cast iron	" "	1·0

These experiments of course refer to lineal expansion only, which in the case of pipes used by plumbers is that with which they are chiefly concerned. But the expansion is in the same proportion in diameter as in length, and in the case of a metal sheet is the same laterally as lineally.

Lead Work on Roofs.

We will first consider these effects in connection with the plumber work of roofs. Lead, you will observe, expands under the influence of heat almost more than any of the metals, namely, 1 in 349, being only exceeded by that of zinc, which expands to a slightly larger extent. Lead being so much used for roofing purposes, the effects of expansion by the direct rays of the sun are very marked. If sheet lead is laid in long, and broad pieces, or bound, so that it is not free to expand at the ends or sides, it will buckle up in small ridges, which, by rising during the day and falling during the night, ultimately crack through (see Fig. 5). This buckling-up and cracking of the lead is greatly facilitated by its softness, which, by the way, is usually regarded by architects as a virtue. The softness is the result of rolling, which is done from a flat block of lead about 7ft. square and 3in. or 4in. thick, cast of pure ingot lead, and rolled out in a mill to 30ft. or 40ft. in length, and of the required thickness. In my early days at the trade, forty-five years ago, cast sheet-lead (which was formerly employed very commonly) was just going out of use, being only used in very exceptional cases. This lead was made by the plumbers themselves, and it was requisite in those days that a plumber's shop should have a large melting-pot for the lead, with a frame or table and apparatus for running out the metal on a bed of sand to the required thickness. It was a peculiarity of this lead that it was always more or less harder than milled lead, which was due to the fact that it was impossible to thus cast pure pig





THE ANCIENT HOUSE, BUTTERMARKET, IPSWICH.

lead. It had to be largely mixed with old run-up lead, which got mixed with tin and other hard metals, and thus produced sheets of the hard character mentioned.

Now, while the soft milled lead under the influence of heat was unable (on account of friction) to slide over the wood boarding as it expanded, the hard cast lead had no difficulty in doing so; if unable to do this, it simply rose up in one great swell in heating (see Fig. 6) and went down in cooling without producing any injurious effects.

Another point in connection with the hardness of lead in relation to its durability was, that in the days of cast lead it was impossible to dress it down with such care, or set it into corners with such accuracy, as is now done with milled lead, with the result that it was left much more free to expand and contract. In those days it was not uncommon to find cast lead sheets 15ft. and 20ft. long by 4ft. or 5ft. wide which had been lying on roofs for many years, showing few signs of decay. Of course, the way to prevent defects in soft milled lead is to lay it in short and narrow sheets, so that it is free to expand and contract at the ends and sides, thus preventing buckling-up in the centre. Sheets not exceeding 10ft. long by 2ft. 3 in. wide are found to stand well, but must not be of less than 6 lb. lead; lighter lead than that should be laid in shorter and narrower sheets; while for ridge and piend flashings, flanks, &c., lengths of not more than 8ft. should be used. These remarks, however, only apply in

a general way to the lead-work of roofs. There are

Exceptional Circumstances

where one part of a sheet of lead may become heated by the rays of the sun, while the other part remains comparatively cool. This applies to lead gutters on roofs facing south, having balustrades or stone blockings in front of them: the sun's rays strike the part lying on the sloping roof, while the remainder is protected, and it is quite a common experience of plumbers to find lead badly cracked on the exposed parts, even though the stretch of lead is not unduly long. To prevent cracking in such circumstances the lead should be made 7lbs. or 8lbs. per foot; indeed it may be safely asserted that the lead generally laid on roofs at the present time is not so strong as it should be, and is far inferior to a great deal of the lead now found in good condition on old mansions, which was laid more than a hundred years ago. In connection with the valuation of fire damage at Penicuik House, which was burned down in 1898, some fragments of the lead covering of the platforms which were saved were found to be 12lbs. per foot.

Special care needs to be exercised in the covering of domes and turret roofs with lead, the tendency being for the expansion under heat to go downwards, the natural weight of the lead preventing its return on cooling. The way to avoid this is to have the lead laid in short lengths, with overlaps at the joinings, at which points the lead is free to expand. Unfortunately there is always a desire to have the lead-work on a spire with a fine smooth finish, and for this purpose the lead is dressed with special care into every corner, and all overlaps avoided. But this only secures a good appearance for a short time, for soon the heat of the sun begins its work of havoc, and destroys the fine appearance. An excellent method is to cover the spires with lead having rolls forming a herring-bone design; this will stand the wear and tear of many years because the lead is put on in small pieces. In point of fact, the more loosely lead is laid on roofs the better, provided it is sufficiently fixed to prevent its being raised by the wind.

A very notorious case of the evil effects of over-working lead on roofs came under my notice more than twenty years ago. The roof of the telling-room of the British Linen Company's bank at Edinburgh was covered with 8lb. lead, and under ordinary circumstances should have remained intact for sixty years without needing repairs. When the roof was laid it was considered to be one of the finest pieces of plumber work in the city, and many practical plumbers went to inspect it. But notwithstanding its supposed superiority, at the end of twenty-five years after it was laid numerous patches of solder had been put on to repair cracks in the lead, and the covering of the dome (which has some roof lights) was so defective and gave so much trouble on account of frequent leakages through cracks that an architect was employed to examine it, and to suggest how it could be improved. Now, in this case, although the sheets were not too large, the effects of heat and cold had been greatly ignored, as the lead was bound hard and fast, and had been greatly damaged by the plumbers overworking it.

It may be mentioned here in connection with repairing cracks in roof leads that a prevalent custom which should be carefully guarded against is the driving of nails into the cracks to keep down the edges of the lead while the soldering is being done, as the tendency is for the edges of the lead to curl up with the heat; this practice binds the lead worse than before, and it is not infrequently found that in a short time lead thus treated cracks again close to the old soldering.

A good method of protecting lead gutters and platforms on roofs is to have them covered with sparred treadle boarding. I have often been surprised at the small amount of damage done to lead so treated, where it had been laid very imperfectly. The sparred boarding prevents the rays of the sun striking the lead, and the space below allows a current of air to pass through, which keeps the lead cool. It is usual, however, to make the spaces between the spars much wider than they should be to make them efficient, either for the purpose above referred to, or to prevent the gutters, &c. becoming choked up with heavy falls of snow. The spaces between the spars should never be more than $\frac{3}{8}$in. wide.

Roofing with Zinc.

Another metal employed by plumbers for roofing purposes is zinc, and as it expands under heat more than any of the other metals, ample provision has to be made to counteract any evil effects. The expansion of zinc is 1 in 322, and this has to be overcome by the sheets being laid in short lengths and left to expand and contract with perfect freedom. To secure this as much as possible the sheets in gutters and platforms need to be laid entirely free of any connection to neighbouring sheets, the junctions being made with rolls and overlaps, and all soldering between the sheets avoided. For roofing purposes zinc is comparatively new. It has now been so employed for about fifty years, and has proved itself a dangerous rival to lead, on account of its cheapness, which arises chiefly from the fact that it is found on the whole fairly lasting and satisfactory, while not having a fourth of the weight of lead. Weight for weight zinc is much dearer than lead.

The chief deteriorating influence in the wearing-out of zinc, assuming it to be properly laid, is the effect of water lying on it for a length of time. If it could be laid in such a manner as to allow the rain to run off at once no harm would be done, but here the effects produced by changes of temperature begin to tell. The sheets of zinc on platforms (and it is for these sheet zinc is chiefly useful on roofs) are 3ft. wide; they are turned up at the two side edges to lie against wood rolls, and these upstands are covered with roll caps. The middle of the sheets under the heat of the sun expand and become blistered, while the edges are kept cool under the roll caps and scarcely expand at all. Hollows are thus formed in which pools of water lie, and chemical action takes place which in course of time produces perforations in the zinc. It is a peculiarity both of lead and zinc, and probably of other metals as well, that after being expanded by heat they do not contract to the same extent in cooling, and therefore these blisters and hollows are always increasing in size. No doubt if the sheets were made narrower this evil would be greatly diminished, and in point of fact I have never seen narrow sheets blistered to anything like the same extent as broad ones. But it is clear that whatever the breadth of the sheets may be the platform should be constructed so as to give a very rapid fall, in order that the water may be quickly and thoroughly carried off, thus preventing the destructive action to which I have referred.

Sheet Copper

is sometimes used for roofing purposes, and in this way comes into the hands of the plumber; and for this purpose there cannot be a doubt of its superiority to both lead and zinc, particularly for covering domes, turrets and spires. Copper expands to the extent of 1 in 581 up to 212 deg. Fahr., which is considerably less than the other metals. But its chief recommendation for roofing purposes is that it can be used extremely thin, and its lightness is of great advantage, as it can be easily fixed and supported. It is further practically impervious to the weather, resisting the tear and wear of time without showing the least indication of decay. A few years ago I removed the sheet copper covering of the old church spire at Lasswade, which had been in place for a hundred years. It had all the appearance of being as good then as on the day when it was first fixed. It was as thin as No. 10 zinc, which is about the thickness of a threepenny piece. Remembering these results, one is surprised that any other metal than copper should ever be used in covering domes and long tapering turret roofs. The recent covering of the dome of St. George's Church, Edinburgh, with sheet copper must strike everyone as being very superior to any other metal that could have been used for the purpose.

From the foregoing remarks it will be seen that the general rule to be observed in connection with the plumber work of roofs is that small sheets of the metal should in all cases be used; that they should be laid and fixed entirely free of one another, so far as soldering as a means of joining is concerned; and that as few nails as possible should be used in fixing the sheets. But as it is difficult in some cases to avoid soldering or nailing, this, when necessary, should be done in such a way that the natural expansion and contraction of the metals under changes of temperature are allowed to go on without damage to the materials themselves. It is not that solder as a useful alloy has any objectionable features in itself, for in point of fact the expansion and contraction of solder under changes of temperature is about the same as that of lead and zinc, but the danger always is that the edges to be joined together will be made fast to the boarding with nails, thus preventing expansion. This is frequently done from mere thoughtlessness, because for the purpose of soldering it is never necessary. Cast-iron gutters and rhones are frequently used for roofing purposes, and so far as they are affected by heat and cold they give no trouble in connection with dwelling-houses. But in long workshop buildings, granaries, bonded stores, &c., provision has to be made to break the continuity of the gutters, otherwise the expansion will damage the joints and be

the cause of trouble. We may now proceed to the consideration of our subject in relation to

Internal Plumber Work,

and here we have greater complications and difficulties to face, as we have not only the effects of heat and cold on the metals themselves, but also these effects on the liquids conveyed in the metal pipes. In this manner we are concerned with effects produced by changes of temperature from zero or lower up to 212 deg. Fahr. or higher. We will consider first the effects upon hot-water pipes. Changes of temperature in what are called cold-water pipes are so limited that no appreciable effect takes place, but in the case of heated water they become very decided. The metal pipes used in connection with pressure hot-water systems are usually of lead, galvanised iron or copper; for waste-water purposes, where hot water is conveyed, cast iron is used in addition. Referring again to our table of expansions, it will be observed that, as lead expands to such a large extent under heat, it is likely to prove very unsuitable for conveying hot water; and so it is; but that is only in certain circumstances, quite well understood by experienced plumbers. When only short lengths are required, and where the pressure is not excessive, lead pipes are found to be quite suitable, provided they are of moderate strength. For example, in houses adapted as flats, where hot-water systems are now so common, lead pipes are found to be very satisfactory; but where there is a very heavy pressure, such as obtains in self-contained houses of five or six flats, the effects of hot-water softening the lead greatly reduce the latter's strength, and unless the pipes are very strong they are liable to burst. Ground water taps, in the absence of proper air vessels to prevent water-hammer, are very destructive to lead hot-water pipes, but the prevalent custom of using screw-down valve taps has effected a considerable improvement in this respect. In long stretches of hot-water pipes the softness of the lead is an advantage, as it yields and bends to one side between the fixings, and further if in long stretches of hot-water pipe there are many bends and turns (as is frequently the case) no evil effects occur, as the expansion is relieved at the turns. No doubt the chief source of weakness in lead hot-water pipes is at the soldered branch joints, which sometimes give way; but this, I believe, is due to the pipes being rigidly fixed and bound at the joints, with no allowance for expansion. If plenty of play is given in the proximity of the joint the pipes will be found to stand well.

An attempt to overcome the tendency of lead pipes to break at the soldered branches and bends was made some years ago by the introduction of brass T-pieces and bends, which were jointed to the lead pipes with solder: this, however, was soon found to be no improvement, but rather the reverse, as it introduced a mixture of metals, which was frequently the cause of the soldered joints breaking. But the fact of having lead and brass brought together in this way does not altogether account for these breakages, because the soldering of brass taps to lead pipes seldom gives way, and the reason is obvious. In the case of the tap there is nothing bound to prevent its expansion; in the other case the pipes are generally held firmly in their place, and hence breakage occurs.

Lead hot-water pipes laid underground or embedded in concrete are subject to severe strain, and even in the case of very strong pipes very soon break; and this applies in a special way to hot-water pipes built into kitchen fireplaces and connected to brass couplings, where in the absence of room for expansion they frequently break—generally at the joining of the brass and lead. It is therefore always advisible, even when lead pipes are used throughout the house, to make the connections of boiler and pipes with harder and more enduring materials. It is my opinion that the reason why lead lost favour for the conveyance of hot water was that the pipes were made of far too light a weight, or rather because they were made of similar weights to the ordinary cold-water pipes, which, only a very few years ago, were very much below the standard of the present day. Lead hot-water pipes of the following weights will give very satisfactory results:—½in. bore, 7lbs. per yard; ¾in., 12lbs.; and 1in., 16lbs. per yard. But these weights of lead pipes cause very expensive work, which has led to the extensive use of galvanised iron pipes (and these without doubt suit the purpose very well). There is certainly a tendency for these pipes to rust, notwithstanding the fact that they are galvanised, but this is largely due to their being imperfectly galvanised. The process is very uncertain in long lengths of small piping, and the danger has to be provided against by using pipes of larger bore than would otherwise be necessary. The evils arising from expansion and contraction of galvanised iron pipes are reduced to a minimum by the very limited effects produced by the application of heat, namely—1 in 846 at 212 deg. Fahr., which is only about a third of that of lead. The result is that I suppose 90 per cent. of the hot-water pipes now fitted in dwelling-houses are of galvanised wrought iron.

The only other metal used by plumbers in conveying hot water for domestic purposes is copper, and doubtless for these purposes it is much superior to either lead or iron, but on account of its great cost it is only employed in exceptional cases. Its use assumes more the aspect of a luxury, and has an effect similar to that of expensive jewellery, as giving evidence of the good circumstances of the proprietor.

Expansion Boxes.

Previous to studying this question I always had the impression that copper expanded under the influence of heat more than any of the other metals used for hot-water purposes, and the reason was as follows. It is a common practice to use what are called expansion boxes where long stretches of copper hot-water pipe exist: these are devices to overcome expansion by allowing one pipe to slip within another when expansion occurs, the pipe slipping back when it contracts. A stuffing-box is used to prevent the moving parts leaking.

Nothing of this kind is required for lead pipes, although the expansion is nearly double that of copper. Then, again, it is quite common to find a copper hot-water expansion pipe, where it passes through and is soldered to a lead platform, forcing itself up through the lead 1in. or more and breaking away from the lead altogether. This never happens with lead pipes. The inference therefore was that copper pipes expanded more than lead, but the reason for this difference is that the copper pipe being rigid has to do all its expansion towards the ends or at bends, whereas lead pipes by their softness wriggle about and make room for themselves. The methods of

Jointing Hot-water Pipes

in view of the effect of heat upon them is a very important consideration. In the case of lead pipes, so far as I know, there is no other method than that of soldering, which, from the fact that the effects of heat upon solder are practically the same as upon lead, makes its use quite successful; and without doubt a good solder joint on a lead pipe is the most perfect form of joint in existence, as the ends of the pipes are practically fused together. In the case of galvanised wrought-iron pipes the method of jointing is with screwed couplings, the ends of the pipes being screwed up into the couplings and connections made with Vulcan cement or red lead; and the manufacture of all kinds of suitable connections, such as bends of many angles, tees, sockets, nipples, jam nuts, &c., renders the use of these pipes extremely simple in all instances.

In the jointing of copper pipes there is greater variety in the methods employed; although in my experience these have resolved themselves almost into the one now commonly followed, namely, screwing and sweating with fine solder, the connections being made of gun metal and screwed to receive the ends of the copper pipe, both being tinned and screwed up in a hot state; this makes a very superior joint. It was not uncommon in my early days at the trade to joint copper pipes for domestic use by means of a soldered joint similar to that of lead pipes, which is followed to this day with large-sized copper pipes, such as are in use in breweries and distilleries, and the joints stood well if done in a proper way. To do this it was essential for the ends of the pipes to have a slip of 1in. into each other, which was secured by one end being hammered on an iron stake and swelled out to form a small tight-fitting faucet, the outside of the spigot end and the inside of the faucet end being tinned and the pipes otherwise prepared for a wiped solder joint before being put together.

I must say I never saw a joint made in this way on a copper pipe show the least sign of decay. But there was a good deal of labour required to make such a joint, and the pipes were often put together with little more slip than edge to edge, the wiped solder joint concealing the defect; it had when finished all the appearance of a perfect joint, but often gave way by the solder joint cracking through the middle.

Brazing or hard-soldering hot-water copper pipes was not uncommon at one time. This necessitated the couplings and connections being made as near the consistency of copper as possible (pure copper cannot be cast), or with what is called brazing metal. But there was always a certain amount of risk in this method; besides the work had to be done by coppersmiths, and only specially skilled men at that, as frequently the metals were burned and weakened, and the defects not discovered for some time after the pipes were in use. By the two foregoing methods, copper tubes of light make could be used, quite strong enough to bear the pressure to which they were subjected, their only weakness being in the jointing. The copper pipes now in use are solid drawn and of sufficient strength to stand screwing with the iron pipe-dies. The usual strengths are:—½in., No. 16 B.W.G.; ¾in., No. 14; and 1in. and 1¼in., No 12. Though these heavy pipes have advantages in jointing, they far exceed the required strength to bear the pressure put upon them, and this makes their use very expensive, and therefore somewhat limited.

Choking of Pipes.

There is one consideration which cannot be overlooked in dealing with this subject, that is, the tendency for hot-water pipes to choke. This evil arises from two causes: first, from the boiling of the water in high-pressure systems, which, if occurring frequently, causes a hard corrosion to gather at the junction of the hot-water pipe to the boiler. This substance, which I suppose is really lime, is as hard as stone, and requires a chisel to remove it. If the water in the boiler is allowed to boil, this silting will often be produced, irrespective of the quality of the water. The second cause of the choking is the existence of a large solution of lime in the water, which is deposited in the pipes. In the first case the choking will take place in the circumstances described with all kinds of pipes, and the first indication of it is frequently a cracking and rather an alarming sound in the pipes when the water begins to boil, gradually getting worse as the evil increases. The sound I believe arises from the difficulty of the steam to escape through the exhaust pipe, on account of the obstruction; and this sometimes has the effect of forcing all the water out of the boiler back into the cistern, leaving nothing but steam in the boiler, which in turn results in several evils, notably the burning of the boiler by the fire, the damage to the boiler caused by the sudden rush of the cold water, and a further danger of damage to the cold water feed-pipe just where it leaves the cistern. At this point it sometimes swells out and bursts in a somewhat unaccountable manner. But it will be observed that all these effects are due to one cause, namely, the boiling of the water. This is quite unnecessary, and may be successfully prevented. The violent boiling that leads to choking generally occurs in a system possessing no circulating tank or circulation of any kind. The introduction of a circulating tank has a wonderful effect in checking the tendency to boil. But there is another method of preventing the boiling, that is, to keep the expansion pipe so low that the hot water flows out of it when it reaches a temperature of about 200 deg. As

is well known, water expands till it reaches the boiling point at the rate of $\frac{1}{23}$in. to the foot, or $\frac{1}{24}$ of its bulk. If, therefore, the expansion pipe is kept lower than $\frac{1}{24}$in. for every foot from the cistern to the boiler above the level of the water in the cistern, the water will never boil: the hot water will flow out at the expansion pipe, and its place will be taken by cold water in the boiler, and thus boiling will be prevented. It may be said that this method might lead to great waste of water; but this can easily be overcome by supplying the boiler from a cistern for its exclusive use (which even now is not uncommon), making this overflowing hot water discharge into this cistern, and thus rendering the water partially warm before it goes into the boiler.

As I have already said, this choking of the flow pipe from the boiler occurs with all the three kinds of hot-water pipes that have been mentioned; but whether it accumulates at the same rate of speed in them all I am not able to say. It is different in the case of hot-water pipes choking with lime from the water. The lime is deposited on the sides of the pipes, and to the greatest extent in the boiler itself and the pipes near it; thus showing that the evil is worst when the greatest heat exists. As a preventative it is found to be a decided advantage to use copper for both boiler and pipes. Iron pipes in such circumstances choke most rapidly, lead pipes next, and copper pipes least of all. I learned a few weeks ago of a case which proved very notably the superiority of copper over iron pipes in resisting this choking. An extensive hot-water heating apparatus had been in use in a large mansion for some time. It was gradually losing its power, and ultimately stopped working altogether. On examination it was found that the system had been constructed partly of wrought-iron pipes and partly of cast-iron pipes and a small part of copper pipe, the copper being sandwiched in between the wrought- and cast-iron portions. Both the cast-iron and wrought-iron portions were found to be almost choked up with lime, while the copper was entirely free and clear. It is difficult to account for this. It used to be held that copper had the advantage by its supposed larger expanding and contracting properties under changes of temperature, causing the lime to scale off; but this cannot be the case, as we now find that the expansion and contraction of lead pipes exceeds that of copper, and yet they choke more rapidly.

Drain, Soil and Ventilating Pipes.

We must now proceed as rapidly as possible to consider another aspect of our subject which in view of the supposed dangers to health arising from defects in connection with it is perhaps the most important—the effects of changes of temperature on drains, soil, waste and ventilating pipes. All the metals to which reference has been made are suitable for these purposes, so far as soil, waste and ventilating pipes are concerned, and the superiority of one over another depends greatly on the method of jointing employed. Undoubtedly the most perfect joint for these purposes is soldering, and in this respect lead is best, provided hot-water is left out of account, because lead expands and contracts to such an extent that it interferes very considerably with its use for the conveyance of waste hot-water, although even in this respect matters have been greatly improved by the introduction of heavy drawn-lead pipes and fittings; and lead traps are generally used, even though the waste pipes are of a different material, and they are satisfactory, provided they have perfect freedom of action. In some cases where concrete flooring is used for bath-rooms there is a danger of embedding the lead trap in the concrete: where this is done the destructive effects of hot water are very great. No doubt copper pipes for soil and waste purposes are by far the most enduring, and they can be used very thin with great efficiency, the solder jointing in their case being as satisfactory and efficient as in that of lead, if done in the manner already described. The cost of this material, however, for this purpose makes its extensive use almost prohibitive, and only in cases where expense is no object is it used. This brings us to the consideration of

Cast Iron,

which is now so extensively used for these purposes, and has proved itself a useful and efficient material. The weak point in the use of cast-iron pipes is undoubtedly the method of jointing, which is usually done with rope yarn and molten lead. This serves the purpose quite efficiently for purely soil purposes, but for drains and waste pipes where hot water is used it is proving itself quite inefficient and untrustworthy. This was brought home to me quite recently in two cases where heavy cast-iron drains (which I had laid only ten years ago) were found, when tested in the usual way, to be far from air-tight; and when opened up it was found that the lead in every joint had started out of the sockets, requiring to be remade. We are now condemning the use of fireclay drains inside houses because the effects of hot water cause rapid decay of the joints, but the use of iron, jointed as described, is only an improvement in degree; in kind the same process of decay takes place. Now it seems to me that this need not be the case. It is many years since cast-iron pipes for hot-water heating purposes were introduced, and as it was found that lead was quite useless for jointing, rust, Portland cement and Vulcan cement were used and found to be much superior to lead; and there is no reason why any of these materials should not be used in jointing cast-iron drains and waste pipes. [At this juncture the lecturer exhibited specimens of jointing on iron pipes, which had been submitted to the ordinary test of heating and cooling alternately for some days. One was an ordinary lead joint, another was made with rust, the third with pure Portland cement, and the fourth of cement and lime, rope yarn being used in all. In the case of the lead joint the effect was just what might have been expected. The jointing started clearly out of the socket. In the cases of the rust and pure cement there was not the slightest indication of movement, thus proving their superiority.] The principle to be observed in jointing, in all cases, is that the jointing material in its expanding and contracting properties should be as nearly as possible the same as the metal jointed, and in this respect rust is the best for cast-iron pipe, as it is in this respect practically the same. For a good rust joint (slow setting) the following can be used:—Sal-ammoniac, 2 parts; flour of sulphur, 1 part; iron borings, 200 parts. Care must be taken, however, in making rust joints that the coating of Smith's solution is entirely removed from the inside of the joints. There is one difficulty in connection with iron drains where rigid jointing of this kind is done. The lineal expansion of the whole stretch has to be provided for, but this could be done by using a simple cast-iron expansion-box placed in the manhole near the disconnecting trap, and it would be a further improvement if iron drains under the house were laid in an open channel to allow the expansion and contraction to go on freely.

There is still a part of our subject to be considered which is of considerable interest. I refer to the effects produced by the

Freezing of Water in Pipes.

I need hardly say that the bursting of water pipes has given rise to quite a number of theories as to the exact cause. As you all know, it is in freezing that the damage is done, *not* in the thawing, as many imagine. Water, in the process of freezing, expands to the extent of one-ninth of its bulk; that is, a column of water 9ft. long would be 10ft. long when frozen, and the same expansion takes place laterally. Now in view of this large expansion, our first idea is one of surprise that so comparatively little damage is done to pipes in freezing. Like the expansion that takes place in metals by the application of heat, this expansion of water in freezing is practically irresistible, and it may be asked, where does this large increase in bulk go when the water in a pipe is frozen? Now there are several reasons for these effects being much more limited in practice than theory would suggest. In the first place water begins to expand at a point three or four degrees above the freezing point, and therefore the water has expanded freely in a liquid state to a large extent before it has frozen at all. In the next place, water, in freezing in a pipe, cannot solidify right into the centre all at once. It must do so more or less gradually, and therefore will expand inwardly, pushing the water before it till it has nearly reached the centre, where the deadly grip will take place, and the weakest part of the pipe within a limited distance yields to the internal pressure. I say advisedly a "limited" distance, for I have frequently seen pipes burst within a very short distance of an open end, showing that only to a very limited extent does the lineal expansion relieve the lateral, that being subject to the strength of the pipe. There are other theories advanced for the bursting of water-pipes by frost which are interesting, but in my opinion they are worthless.

One is that water in freezing parts with a large quantity of air, which accumulates at bends in the pipe, and when a rise in temperature takes place this air expands and bursts the pipe. This may be termed the "pneumatic" theory. Another is that bursting is caused by freezing taking place at two places at one time in a pipe containing water, and the ice expanding at these two points produces such a pressure on the water between the two that the pipe is burst. This may be called the "hydraulic" theory. But burst water-pipes in their frozen state have always ice protruding from the fracture, which could not be the case in any of these theories, as air in the one and water in the other are presumed to be inside the pipe at the point where it bursts. A new form of lead pipe was patented a few years ago by Messrs. Adams and Co., of Leeds, which was expected to entirely obviate the bursting of water-pipes from frost. It had an indentation on one side, and when the water in this pipe freezes the ice pushes out the indented part without doing any harm. But you will observe that this only puts off the evil day, as when the water thaws the indentation does not resume its old shape, and the next time it froze there would not be the same power to resist the pressure, and the pipe would probably burst. This is an expensive form of pipe, for in making it as much material is required for a pipe of the capacity of $\frac{3}{4}$in. bore as is needed for an ordinary pipe of 1in. bore.

After all that has been said it will appear that it serves little purpose to discuss theories on such a complex question. The cause and effect are quite well known, and what is required is that ample means of protection are adopted to prevent damage: this means just thoroughly wrapping up all water pipes in the least degree exposed to the action of frost, and this applies most particularly to supply and expansion pipes of pressure boilers, the simultaneous freezing of which leads sometimes to very direful results.

I have thus endeavoured in a very general way to point out some of the effects of heat and cold on plumber work, which have been drawn chiefly from my own experience. It will be observed that trustworthy information of this kind can hardly be gained in any other way. The reading of books, giving the results of other men's experiences, and the studying of the laws of nature as they bear on the question assist us only to a very limited extent; and I trust the remarks that have been made will have the effect of fostering the desire and sharpening the observation of the members of this Association in gaining a fuller personal knowledge of the subject.

A New Organ Screen of carved oak has been erected in the Unitarian Church, Blackwater Street, Rochdale. It is in the Perpendicular Gothic style, and is a part-closed screen. The lower parts are raised and ornamented with "linen panels," the moulds and general arrangement of the wood taking the form of folded drapery. The transom line is carved, and rising from this are four bays pierced in their lower parts and above, having ogee and crocketed heads. Still higher is lined flowing tracery. The whole is surmounted by a carved and embattled cornice. This screen, like the font cover, the carved screen in the vestibule, etc., was designed by Messrs. Butterworth and Duncan, and has been carried out by Messrs. Harry Hems and Sons, of Exeter.

THE EFFECT OF FREEZING ON CONCRETE.*

BY WALTER A. ROGERS.

WITH the constantly-increasing use of concrete, questions as to its qualities are continually arising. It has been a commonly accepted opinion among engineers that the building of concrete masonry, especially above ground, during freezing weather is bad practice and one to be avoided if possible. The writer has frequently found it necessary to put in Portland-cement concrete footings during the winter months and considerable care has always been taken to protect the freshly-mixed concrete from freezing. There has, however, been a feeling of uncertainty as to the effect of freezing if it should take place before the concrete has thoroughly set.

In order to determine as far as possible by experiment the result of freezing Atlas Portland-cement concrete and Louisville-cement concrete, which were taken as types of Portland and natural cements, eight 12-in. cubes of each kind of concrete were made and tested as described in the accompanying tables:

as made, and left to freeze and thaw until broken at the end of 28 days.

Referring to Table No. 1, showing the effects of freezing on the Atlas-cement cubes, it will be seen that the two cubes which were left in the office, Nos. 103 and 104, developed an average strength at the end of 28 days of over 185,000lbs.—which was the capacity of the testing machine employed; but probably the strength of these cubes did not much exceed this amount, as one of them began to fail at that load.

The two cubes which were placed outside in a temperature of about 15 degs. below zero immediately after being made, Nos. 147 and 148, developed an average strength of 115,000lbs. The two cubes made at the same time and left out-of-doors for the same length of time and then kept in a warm room for 28 days more developed a strength of over 185,000lbs., probably greater than that shown by the two cubes left in the office for 28 days, since no sign of failure by either of these cubes was manifest, indicating that the freezing of these four cubes had the effect merely of causing the concrete to harden more slowly than it would have done under more favourable conditions of temperature. The two cubes mixed with salted water and then exposed to the cold for 28 days developed a strength of over 185,000lbs., probably about the same as that of the two unexposed cubes.

at the end of 28 days. Cubes Nos. 157 and 158, made at the same time as the last two and left out in the cold for the same length of time and then kept in a warm office for 28 days longer, had an average breaking-strength of 52,500lbs. The two cubes mixed with salted water and exposed for 28 days developed a strength of 35,000lbs., being but little more than those treated in the same way and mixed with fresh water.

The same deductions may be made from the tests of Louisville-cement concrete as from the Atlas tests, with the exception that the use of salt seemed to have had little, if any, effect on the strength of the cubes exposed to the cold. The fact that the extreme cold seems to have merely caused the hardening of the concrete to proceed more slowly than under more favourable conditions of temperature is brought out in a marked manner by the fact that the cubes left out in the cold for 28 days and then kept inside for 28 days developed a strength of 20 per cent. greater than those which were kept inside for 28 days and then broken.

A certain retaining wall was built of Louisville-cement concrete, faced on the top and front with Portland-cement mortar. The weather was quite cold part of the time while the concrete was being mixed, and part of it must have frozen before setting had entirely taken place. The 2-in. plank form was left in position until the Spring, and about 4in. or 5in. of sand was placed on the top of the wall. In removing the form last Spring it was found that the body of the concrete, to all appearances, was in good condition. About 6in. from the top, however, the Portland-cement facing was badly cracked, and by sounding occasional spots were found both in the Portland-cement facing and in the back of the wall, where there seemed to be a thin loose shell. Evidently these are surface defects, and the wall itself appears to be in good condition.

The writer believes that the foregoing tests indicate that concrete work with cement possessing qualities similar to those tested may be carried on safely during moderately cold weather by using proper precautions, such as warming the materials and the water, and by so protecting each layer of concrete that its top shall not freeze before the next layer is laid.

[NOTE.—The temperatures recorded are Centigrade.]

TABLE No. I.

TESTS TO DETERMINE THE EFFECT OF FREEZING ON ATLAS-CEMENT CONCRETE.

Concrete composed of 1 *part cement*, 3 *parts gravel*, 4 *parts broken stone.*

No. of Cube.	Date made.	Date broken.	Variation of Temperature. Max.	Min.	Treatment of Cube.	Crushing-stress in lbs.	Behaviour in Testing-machine.
103	*Feb. 6, 1899.	Mar. 6, 1899.	80°	18°	Kept in warm office from time made until broken.	Over 185,000	Unbroken, slight flaking, no cracks.
104						185,000	Slight flaking, split on one side in line of stress.
147	Feb. 6, 1899.	Mar. 6, 1899.	57°	-24°	Placed in open air as soon as made and left to freeze and thaw until broken.	130,000	Split and flaked in line of stress.
148						99,600	
149	Feb. 7, 1899.	Mar. 7, 1899.	57°	-24°	Mixed with salt water, placed in open air as soon as made and left to freeze and thaw until broken.	Over 185,000	Unbroken, slight flaking, no cracks.
150						185,000	Slight flaking, split on one side in line of stress.
151	Feb. 7, 1899.	Apr. 4, 1899.	57° Outside and 85° Inside.	-24° 32°	Placed in open air as soon as made and left to freeze and thaw for 28 days, then placed in warm office for 28 days more, then broken.	Over 185,000	Unbroken, slight flaking, no cracks.
152						Over 185,000	

* Fire went out and temperature dropped below freezing for a short time on two nights.

TABLE No. II.

TESTS TO DETERMINE THE EFFECT OF FREEZING ON LOUISVILLE-CEMENT CONCRETE.

Concrete composed of 1 *part cement*, 2 *parts gravel*, 4 *parts broken stone.*

No. of Cube.	Date made.	Date broken.	Variation of Temperature. Max.	Min.	Treatment of Cube.	Crushing-stress, in lbs.	Behaviour in Testing-machine.
119	Feb. 13, 1899.	Mar. 13, 1899.	85°	40°	Kept in warm office from time made until broken.	43,400	Gradually failed by splitting and flaking in line of stress.
120						Defective	
153	Feb. 11, 1899.	Mar. 11, 1899.	57°	-10°	Placed in open air as soon as made and left to freeze and thaw until broken.	28,700	—
154						37,000	
155	Feb. 13, 1899.	Mar. 13, 1899.	57°	-10°	Mixed with salt water, placed in open air, and left to freeze and thaw until broken.	34,200	—
156						35,700	
157	Feb. 11, 1899.	Apr. 8, 1899.	57° Outside and 85° Inside.	-10° 40°	Placed in open air as soon as made and left to freeze and thaw for 28 days, then placed in warm office for 28 days more, then broken.	54,200	—
158						50,900	

The gravel was composed of about two-thirds clean coarse sand and one-third small stones. The crushed stone was crusher-run limestone. The cubes were all made by the same man and those for the same kind of cement were made on the same or on succeeding days. The specimens were moulded in boxes made of 1-in. boards, and left in these until taken out to be broken. Two of the eight cubes of each kind of concrete were mixed with salted water in the proportions of one pint of salt to ten quarts of water. The other six were mixed with ordinary hydrant water. Two of the latter were kept in a warm office until broken; they were used for purposes of comparison. Four were placed out of doors as soon as mixed in a temperature considerably below zero, and left outside for 28 days, when two of them were broken and two taken into the warm office and left for 28 days more before breaking. The two cubes of each test which were mixed with salted water were placed outside as soon

Bricks and Mortar.

APHORISM FOR THE WEEK.

Whoever has so far formed his taste as to be able to relish and feel the beauties of the great masters has gone a great way in his study.—SIR JOSHUA REYNOLDS.

Our Plates. THE stables which form the subject of Mr. W. Lee Clarke's drawing were designed by Mr. F. Dening. The new High School at Clonmel (Mr. W. Doolin, architect) is interesting as the first of a type of school new to Ireland. The educational system in vogue in that country has not conduced to the development of school planning on anything like the advanced lines prevalent in England and on the Continent for years past. While higher education has, from a certain standpoint, maintained a very high comparative level, and Trinity College, Dublin, counts herself second to no university in Europe, elementary and secondary education has not kept pace with modern developments; hence the average Irishman who cannot afford a University course is placed at a distinct disadvantage. This is the reason why the planning of schools is deficient. The elementary schools are invariably planned on the obsolete models of the Irish National Board of Education, who, by an iniquitous system, supply plans and specifications of the most primitive kind to any school manager who chooses to apply, and even in cases where private practitioners are employed the same planning is more or less adhered to, the guiding principle being the maintenance of the "large schoolroom plan" to the exclusion of the modern "classroom system," so obtaining the maximum of noise with a minimum of educational results. The Roman Catholic Order of Christian Brothers, in order to overcome the evils of the old system, have decided to erect a series of High Schools for secondary education in the principal towns. The school at Clonmel is but a modest attempt in this direction, but it is hoped in the near future to effect greater results. The building is situated very favourably on an open site at the outskirts of the town. The materials used are red brick of a pleasing variegated purple-red, from the Cork Brick Company's works, with light-blue local limestone dressings. The brickwork is strongly pointed white, and all the woodwork is painted ivory white. The roofs are covered with thick heavy Killaloe slates of a grey-green tone. The school has two classrooms on each floor, hall, cloakroom and lavatory, teachers' room and separate lavatory. Seating accommodation is provided for every pupil (an unusual feature in Irish schools), and the pupils' sanitary building is situate in the playground. The general contractor was Mr. Patrick Costen, Waterford; Mr. D. P. Curtis, of Dublin, carried out the sanitary plumbing, drainage and lighting. Movable partitions were supplied and erected by the North of England School Furnishing Company, of Darlington.—The design for the new Baptist Church at High Street, Willesden Green, N.W., was submitted in a limited competition, and the author (Mr. E. Harding Payne, A.R.I.B.A.) has been selected to carry out the work. Accommodation is provided for seating 418 persons on the ground floor and for 338 in the galleries, a total of 756 adults. An organ gallery is provided at the back of the pulpit. The various vestries will be used in conjunction with the Sunday School, which will be at the back of the church with entrance in Huddlestone Road. The Sunday School is arranged on two floors, and will accommodate about 500 children. The estimated cost for chapel and schools is £5,500.

The South Kensington Appointments. COMMENTING on the appointments of new professors at South Kensington the "Daily Chronicle" says: "As for Mr. Lanteri, he has been for years in the employ of the Board of Education as Teacher; he now becomes Professor—of Sculpture or Modelling. Mr. Moira, the Professor of Painting, has, it is true, done some very accomplished work in decoration and painted a few pictures. But what does he know about teaching? It is an astonishing choice, but it may turn out a good one. Mr. Beresford Pite is favourably known to architects, while to Mr. Lethaby seem to fall the favours, not only of the County Council, but now of the Board of Education. But none of these appointments can be compared to the tardy and unaccountable move of the Royal Academy in choosing Mr. Alfred Gilbert as Professor of Sculpture. It is another of the occasions when the Academy saves itself just when it was given up as hopeless. No better choice could have been made, though it would have been a far greater honour to South Kensington had he been called there. But, as it is, Mr. Gilbert's election is an extremely honourable acknowledgment on the part of the Academy. If Academicians will now abolish the system upon which their schools are run, make Mr. Sargent Professor of Painting, Mr. Abbey Professor of Illustration, Mr. Norman Shaw of Architecture, Mr. Frampton or Mr. Onslow Ford of Decoration, they might be able to compete successfully with private schools, and thus attract the better-class students."

Teaching of Archæology in Schools. AT the recent Headmasters' Conference, held at Bradfield College, Dr. Gow (Nottingham) said the main function of archæology was to quicken their imagination of the lives of the men who made the history and literature that they were all studying. Professor Gardner and his brother were moving in this matter, and he hoped the conference would give it respectful consideration, and thus add more life and vividness to classical studies. It was out of the question to establish a decent archæological museum, but the conference might pass a resolution that the paper of Professor Gardner and his brother should be referred to the committee for the purpose of obtaining more definite information and advice on the subject. The committee, he understood, were willing to undertake that responsibility. Dr. Field (Radley) seconded the motion. Dr. Fearon strongly agreed with the general principle of Dr. Gow's speech and resolution. He was very much in favour of having a room filled with casts, models and photographs, and this could be done at a very small expense. After a few words from Mr. Fausset, the resolution was carried.

Irregularities in Italian Mediæval Architecture. IN the course of a lecture delivered before the Architectural Association of Ireland on "Some Intentional Irregularities in Italian Mediæval Architecture," Mr. C. J. MacCarthy, city architect of Dublin, dealt with a number of articles published a few years ago in an American architectural magazine by Mr. W. H. Goodyear, a well-known American authority on architecture and archæology. These articles attracted a great deal of attention. Mr. Goodyear, a considerable number of years ago, when he was spending a holiday in Italy, noticed certain peculiar irregularities which he thought could not be due to mere accident. A few years ago he was sent by the Brooklyn Institute of Arts to pursue investigations, and in the articles which he published he had shown by illustrations that there were in many churches in Italy deviations from straight lines. He had come to the conclusion that these deviations were found in reality to be curved lines. Mr. Goodyear had also given a series of photographs of these buildings, and some of these would be found in the Dublin Science and Art Museum. Amongst other irregularities which struck one in these churches was the diminution of the space between the pillars in the nave arcade, and this diminution was always in the same direction, namely, from the west end, or entrance front of the church, towards the east end. Mr. Goodyear's view was that these things were done intentionally, with the view of producing an increased appearance of length, and consequently an increased appearance of size in the building, by methods very similar to the methods adopted by theatre scene-painters to-day.

A Relic of Milton's London. A genuine bit of Milton's London is to be moved in Fore Street, E.C. Every antiquary knows the fine old gateway leading into the churchyard of St. Giles's, Cripplegate, with its inscribed date, 1660, and its emblems of the flight of time—a scythe, hour-glass, skull and cross-bones, &c. This gate, known locally as the "Great Gateway," is a notable relic of London before the Great Fire. Through it Milton must have been carried to his resting-place in the church, and its grim sculptures must often have caught the young eye of Daniel Defoe, who was born in Fore Street. It is not without misgiving that one learns that this gateway is to be set back several feet. The four quaint houses which adjoin it, and which are of even older date, are also to come down.

New London Theatres. IN the early part of 1895, says the "Daily Chronicle," theatrical managers and speculative builders were seized with an epidemic of theatre building which has swept over the suburbs of London, carrying with it fortunes for some and ruin for others, but, so far, mainly the former. Between 1884 and 1894 there were only four recognised theatres in the suburbs—the Grand, Islington; the Parkhurst, Holloway; Morton's, Greenwich; and the Theatre Royal, Stratford, which still exists in spite of the close proximity of the more pretentious Borough Theatre. But the house whose success gave rise to the present theatre-building craze is the Metropole at Camberwell, opened in October 1894. Since then no less than seventeen new theatres have been opened, and eight have been projected, most of the latter being now in course of completion. It is calculated that the aggregate capital sunk in the building of these new theatres, apart from the working capital, is about half a million sterling, and a further sum of £180,000 is represented by the eight projected houses. As regards the latter, the new Camden Town Theatre was opened at Christmas, the houses for Chelsea, Holloway, and Wimbledon are rapidly approaching completion, those for Dulwich and Poplar are well in hand, and the Hampstead and Walthamstow plans are completed. Kilburn, although not marked on the map for a new theatre, will probably have one before long, the little make-shift theatre of some three or four years' life having been recently converted into a music-hall. For some time a site near the Royal Oak Station was labelled for "a new theatre," but the label has lately disappeared. A Jewish theatre is in contemplation for the East End. All this building of theatres in the suburbs will naturally have an effect on those places of amusement inside the metropolitan area and it will be interesting to watch the changes which will undoubtedly take place.

Rochester Castle. THE repairs to the keep of Rochester Castle arranged to be executed during 1900 are now completed. The work has been carried out under the supervision of Mr. G. Payne, F.S.A. The southern interior half of the building, as far down as the floor level of the State Chamber, has been restored, and certain arches which were structurally unsafe have been made good. Abundant traces were discovered while the central wall was being repaired that the keep had at some period suffered from the ravages of fire. Both faces of the wall were covered with drips of molten lead, which had run down from the roof and gutters, and a thick layer of that metal was also found lying on the projecting capitals of the columns. The cleaning out of the well of the keep proved to be a laborious work. The total depth from the top of the central wall of the keep to the bottom of the well was found to be 136ft., and the diameter of the well shaft from 2ft. 9in. to 4ft. At low tide the water in the well stands at a normal depth of 18in., but at high tide it becomes increased to 9ft.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Forming a Tennis Court.

LONDON.—INQUISITIVE writes: "(1) How is the turf removed for levelling a tennis court? (2) How are the levels staked out as a guide to the workman? (3) Must new ground be made higher to allow for settlement? (4) What are the dimensions of a full-size court? (5) What is the best time to start such a work?"

(1) Roll it and cut it about 1½in. thick, 3ft. long, and 1ft. wide. (2) After settlement of the level proposed, if only a straight-edge and an ordinary spirit-level are available, drive a peg in at the finished level and place on it the straight-edge, which would probably be 10ft. long. Having placed on this a spirit-level, drive in at its end another peg so that these two pegs are level. If boning-rods are available (that is, pieces of wood 3ft. high by 3in. wide by ½in. thick, with cross-pieces nailed on, 1ft. long by 2in. by ½in., all being of the same length, making a T), hold two of these boning-rods on two of the pegs, and, looking along the line of the top cross-pieces of the boning-rods, drive in a third peg in the same line and level with the first two; this would be done in the length of the court and across it. If the tennis court is to have a slope in one direction the two ends would have to be levelled as described and a level surface obtained by means of the boning-rods. (3) In newly-filled ground ½in. to the foot of depth should be allowed for settlement, unless it is rammed. (4) The dimensions of a full-size court are 78ft. by 36ft., but a levelled space of at least 10ft. should be left all round the actual court measurement. (5) The present time is suitable for starting such work. Querist says nothing about the drainage or treatment of the ground. According to the nature of the ground drains should be put in having a fall of not less than 1 in 60 about 2ft 6in. deep and 25ft. apart. On the top of the drain pipes there should be a filling of burnt ballast or cinders mixed with the filled-in soil to within 6in. of the surface, and connected with a layer of ballast. A tennis ground should have 6in. of soil overlying ½in. of burnt ballast or cinders connected with the ballast filled in over the drains. Underneath the top 6in. of soil the ground should be broken up. A. E. M.

Bearing Pressure on Bolts in Roof Truss.

ST. LEONARDS-ON-SEA.—E. D. R. writes: "I find Mr. Adams gives in his book on 'Practical Designing of Structural Ironwork' a ⅞in. bolt for the connection of a short strut with 1⅛in. tie-rod of an iron roof-truss. Does he then neglect the thrust of the strut which would require a larger bearing area than that afforded by the ⅞in. bolt? My calculation is as follows according to Rivington, Part IV., page 144:—Thrust on strut 1·71 tons; size of strut 2in. × 2in. × ½in. angle iron. Taking resistance to bearing as 5 tons, $\frac{1\cdot71}{5}$ = number of square inches required for bearing area. Bearing area of bolt = ½in. (that is thickness of strut) × diameter of bolt; therefore $\frac{1\cdot71}{5} \div \frac{1}{2}$in. = diameter of bolt = $1\frac{71}{100} \times \frac{1}{5} \times \frac{4}{1} = \frac{171}{100} \times \frac{1}{5} \times \frac{4}{1} = \frac{684}{500} = 1\frac{92}{500}$; say 1⅞in. bolt."

In the book referred to, namely, "The Practical Designing of Structural Ironwork," the bearing pressure in wrought iron is given at p. 30 = 5 tons per sq. in. for ordinary cases, or 7½ tons per sq. in. as a maximum. In the case of a roof truss the maximum might certainly be adopted. $\frac{1\cdot71}{7\cdot5 \times \cdot25} = \cdot91$ diameter of bolt, and the ⅞in. bolt shown in design would be sufficiently large. As a rule no calculation is made for bearing area of bolts in a roof truss although of course it should be duly considered in a properly designed roof.

HENRY ADAMS.

Strength of Rolled Joist.

ILKLEY.—R. F. writes: "What is the safe distributed dead load to put on a steel joist 16in. by 8in. by 20ft. clear span, the bottom flange of average ⅞in. metal? (This question was set at the R.I.B.A. Final Examination held last June.)"

At an examination the candidate is dependent upon his own resources and has no manufacturers' lists to refer to for strength of rolled joists. The well-known formula for bending moment under uniformly-distributed load of $\frac{Wl}{8}$ will occur to him as more useful than the special formula for rolled steel joist $\frac{10\,ad}{L}$ because the a in the latter includes the flange and one-sixth area of web of which he has no particulars. Then $\frac{Wl}{8} = \frac{W \times 20}{8} = 2\cdot5$ W in foot tons. This divided by the depth in feet $\frac{16}{12}$ gives the stress in flange $= \frac{2\cdot5 \times W \times 16}{12} = \frac{10}{3}$ W, in tons. The flanges being each 8in. × ⅞in. the sectional area will be 7 sq. in. and allowing a working stress of 10 tons per sq. in., which is a medium allowance for rolled steel joists if the flange alone be taken into account, we have $\frac{10}{3}W = 7 \times 10$, whence $W = \frac{7 \times 10 \times 3}{10} = 21$ tons. On reference to several catalogues of rolled joists we are unable to find a 16in. joist with a greater width of flange than 6in., and a 16 × 6 × 62 lb. R.S.J. will, according to one of the best lists, permit a uniformly distributed load of 24 tons to be carried on a 20ft. span with a maximum stress of 8 tons per sq. in.

HENRY ADAMS.

Architectural Prospects in Australia.

YORKS.—QUERIST writes: "Can you give me any information in regard to the prospects for a chief assistant or a young architect in Australia? Which part of the country would be likely to be the most suitable?"

[We are informed by the Chief Clerk to the Managing Committee of the Emigrants' Information Office, that he has no information that architects are wanted in any colony of Australia.]

Ventilating Shafts.

LLANGOLLEN.—SANITAS writes (in a very rambling manner—querists should be as explicit as possible): "(1) Must the ventilating shafts on the gable and back elevation shown on the enclosed sketch (not reproduced) be of exactly the same height? (2) Is it necessary to carry the shaft on the gable more than 18in. or 2ft. above the wall plate? (3) Is this shaft big enough (it is of 2½in. pipes)? (4) On page 298 of your issue for November 14th last you show the fresh-air drain entering at the top of a manhole. Unfortunately I have taken my fresh-air drain lower down. Is it necessary to alter it?"

(1) There is no advantage in having the two ventilating shafts of exactly the same height. (2) The ventilating shaft fixed at the gable end of the building should be carried above the ridge, so that the wind may blow freely over and around the upper end of the shaft. By this means the action of the wind assists in the extraction of the vitiated air within the drains. At the same time care should be taken that the ventilating shaft terminates a few feet away from the chimney, so as to avoid the risk of direct down-draught between the ventilating pipe and the chimney. (3) The ventilating shaft should not be less than 4in. in diameter. (4) It is desirable to place the fresh-air inlet near the top of an ordinary disconnecting chamber for the reasons already stated (see issue for November 14th). Under the circumstances mentioned by querist, however, it seems unnecessary to reconstruct the existing manhole and fresh-air inlet if thoroughly satisfactory in other particulars. Coleman's "Sanitary House Drainage" (E. and F. N. Spon, Ltd., 6s.) is a well-known practical work on this subject, containing full information respecting the details and principles of construction of house drainage and sanitary plumbing. T. E. C.

Gods and Goddesses of the Greeks.

SUNDERLAND.—ENQUIRER writes: "Is there a book published on the Gods and Goddesses of the Greeks in relation to the dedication of their temples, with any legends that are connected with them?"

"Olympos: Tales of the Gods of Greece and Rome," with forty-seven woodcuts and six full-page photographic plates. Crown 8vo. 7s. 6d. By Talfourd Ely. "Excursions in Greece to Recently Explored Sites of Classical Interest" (Mycenæ, Tiryns, Dodona, Delos, Athens, Olympia, Eleusis, Epidauros, Tanagra: illustrated. Crown 8vo. 7s. 6d. By Prof. Charles Diehl (translated). "Manual of Mythology in Relation to Greek Art," with 140 illustrations. Crown 8vo. By Maxime Collignon, translated and enlarged by Jane E. Harrison. Price 7s. 6d. The three above-mentioned books are published by H. Grevel and Co., 33 King Street, Covent Garden, W.C. "Mythology and Monuments of Ancient Athens." Fully illustrated. 8vo. By Jane E. Harrison. (Macmillan and Co., St. Martin's Street, Leicester Square, W.C. Price 6s.) J. A. M.

Bacterial Treatment of Sewage.

G. O. writes: "I shall be glad to know where to obtain information about the bacterial treatment of sewage, and the best method of putting it into practice."

A great deal of information relating to the bacterial treatment of sewage has been published in THE BUILDERS' JOURNAL. Mr. Scoble's paper on this subject was printed in our issue for February 21st last, the general conclusions derived from the experimental bacterial treatment of raw sewage in coke beds at the outfalls of the London sewage into the Thames will be found in the issue for March 21st last, "Sewage Disposal," by D. Balfour (May 17th, 1899), "Bacterial Treatment of Sewage," by George Thudichum (December 14th and 21st, 1898); and other particulars can be obtained by referring to back volumes. A number of books have been written on the subject, one of the most recent of which is "Sewage and the Bacterial Purification of Sewage," by Dr. Rideal (Robert Ingram, Pleydell House, Pleydell Street, Fleet Street, E.C., price 14s.). In our issue for December 19th we published a report of Dr. Adeney's lecture on sewage disposal, which will no doubt be of interest to our correspondent.

Brick Culverts.

RAILWAY writes: "I should be glad to know whether 'Engineering,' 'The Engineer,' or any other magazine has ever published any working drawings of small brick or concrete culverts for a single line of railway."

Our correspondent had better apply to the papers he names. The office of "Engineering" is at 35 and 36 Bedford Street, Strand; and that of "The Engineer" at 33 Norfolk Street, Strand.

A Legal Point about Contracts.

DURHAM.—F. C. writes: "A tendered for the erection of a building for B, and his tender was accepted. After going on satisfactorily for some time A was compelled (owing to losses on other contracts) to give up this job, when B took possession of all the prepared material and left the completion to C (whose tender was next above A's), but without any fresh competition. B now proposes to allow A for the work he did, and for the materials prepared, not according to A's schedule of prices, which formed part of the conditions of contract, but just as much, or as little, as C says he can allow. I shall be glad to know if he is justified in doing this, in view of the fact that some of C's prices are simply impossibly low; in fact,

although C's tender was 17½ per cent. above A's for the whole work, yet the amount he offers is 25 per cent. below A's claim."

B is bound by his contract. Even if the withdrawal of A raised any difficulty, the taking possession of the prepared materials by B overcame that difficulty. B is therefore liable to pay for the work done and materials prepared according to the original tender.

A. O. H.

Rendering Plasterwork Weatherproof.

A. T. P. writes:—"I should like to know how to prepare plaster of Paris so that it will resist the effects of the weather. Can signs be made in plaster or cement? If so, which is the best method to adopt?"

Plaster can be indurated so as to resist the effects of weather by painting the surface with litharge oil: made by mixing litharge with hot linseed oil in the proportion of one part of litharge to three parts of oil. The plaster surface must be perfectly dry before the oil is applied, and the oil should be warm when used, so as to fill the pores of the plaster. Two coats will be sufficient. Plaster is also indurated by painting with a strong oil paint. The painting must be done periodically to ensure success. Fibrous plaster signs have been used with success in various districts. "Petrura" signs, which are strong, weatherproof, light and readily fixed, are the latest in plaster signs. They are made in various ornamental designs and colours. Further particulars and prices of these signs can be had from W. Millar, No. 1 & 3 Arches, Battersea Park Station, London.

W. M.

Waste from Photographic Dark-Room.

TROON.—CAMERA writes: "If the waste from a photographic dark-room were discharged into a lead gutter on the roof, would the chemicals act injuriously on the lead?"

Chemical compounds containing acetic glacial acid, hydrochloric acid, nitric acid, pyrogallic acid, sulphuric acid, &c., in a concentrated form are destructive to lead; but the weak and diluted solutions ordinarily used in photography would have no appreciable effect on a lead gutter laid to good falls, more especially as the liquid waste from a dark-room generally includes a large volume of water used for washing plates, prints, &c. If practicable, it would be better to remove the refuse liquids from the dark-room by means of a cast-iron waste pipe, arranged to discharge over a surface gully at the ground level.

T. E. C.

Architects' Registration.

DUDLEY.—B W. writes: "In October, 1897, I was articled for three years—I was then fifteen years old. My time is now up, and I should be glad to know whether, in the event of the Architects' Registration Bill coming into force, I should have to pass the examination in order that I might be enrolled"

This query is practically answered by the one printed on page 355 of our issue for December 5th last. Any person who has served as apprentice or assistant to an architect for seven years in the aggregate, after having attained the age of fifteen years *prior* to the passing of the Act, shall, on payment of certain fees and the making of a declaration, be entitled to be registered. An applicant for admission *after* the passing of the Act must not be less than twenty-one years of age, and must (except in certain specified cases) have served as an apprentice to a registered practitioner, and have passed a qualified examination in accordance with the Act.

New Patents.

CARLISLE.—J. L. H. writes: "In the list of patents published in your issue for December 12th is one numbered 1899—18,322, Cameron, Commin and Martin, apparatus for regulating the delivery of sewage to filters or on to land. Where can I obtain further particulars of this apparatus?"

Specifications of patents can be obtained from the Patent Office Sale Braneh, 25 Southampton Buildings, Chancery Lane, W.C., price 8d. each, post free. For ordinary specifications the name of the patentee and the number and year of the patent must always be given.

R. I. B. A.

PROPOSED REVISION OF THE "SUGGESTIONS" FOR ARCHITECTURAL COMPETITIONS.

AT the business meeting of the Royal Institute of British Architects to be held on Monday, January 7th, the chairman will move the adoption of the amendments and additions indicated below, in the "Suggestions for the Conduct of Architectural Competitions." The paper as revised reads as follows:—

1. The promoters of an intended competition should, *as their first step*, appoint one or more professional assessors, architects of established reputation, whose appointment should be published in the original advertisements and instructions, and whose decision should govern the selection of the designs.

The president of the Royal Institute of British Architects is always prepared to act as honorary adviser to promoters in their appointment of assessors.*

All the designs sent in should be submitted to the assessors.

2. The duty of assessors should be—

(*a*) To draw up the particulars and conditions as instructions to competitors, and to advise upon the question of cost;

(*b*) To determine which of the designs conform to the instructions, and to exclude all others;

(*c*) To advise the promoters on the relative merits of the designs admitted to the competition, and to make a selection in accordance with the conditions.

3.† Every promoter of a competition, and every assessor engaged upon it, and any employé of either, should abstain absolutely from competing, and from acting as architect, for the proposed work.

4.† The number and scale of the required drawings should be distinctly set forth, and they should not be more in number, or to a larger scale, than necessary to clearly explain the design. If perspective views be required, it should be so stated; and they should be uniform in size, number, mode of colouring, mounting, or framing (if any), &c.

5. Competitions should be conducted in one of the following ways:

(A) By advertisement, inviting architects willing to compete for the intended work to send in designs. The promoters, with the advice of the assessor or assessors, should make their selection from such designs. The author of the design awarded the first place should be employed to carry out the work.

(B) By advertisement, inviting architects willing to compete for the intended work to send in their names by a given day; with such other information as the candidate may think likely to advance his claim to be admitted to the competition. From these names the promoters, with the advice of the assessor or assessors, should select: (*a*) an architect to carry out the work; or (*b*) a limited number to compete, and each competitor thus selected should receive a specified sum for the preparation of his design. The author of the design awarded the first place should be employed to carry out the work.

(C) By personal invitation to a limited number of selected architects, to join in a competition for the intended work. Each competitor should receive a specified sum for the preparation of the design. The author of the design awarded the first place should be employed to carry out the work.

6. No design should bear any motto, device, or distinguishing mark; but all designs should be numbered by the promoters in order of receipt. Any attempt to influence the decision of the promoters, or of the assessor or assessors, should disqualify a competitor.

7. In every case the amount of premium or remuneration for the competitive designs should be fixed‡ under the advice of the assessor or assessors, *and should be paid in addition to the usual professional charges for carrying out the work.*

8. Where a deposit is required for supplying the instructions, it should be returned on the receipt of a *bonâ fide* design; or if the applicant declines to compete and returns the said instructions within a month after their receipt.

9§ Each design should be accompanied by a declaration, signed by the competitor, stating that the design is his own personal work, and that the drawings have been prepared under his own supervision.

10. A design should be excluded from a competition—

(*a*) If sent in after the period named (accidents in transit excepted);

(*b*) If it does not substantially give the accommodation asked for;

(*c*) If it exceeds the limits of site as shown on the plan issued by the promoters, the figured dimensions on which should be adhered to until officially altered;

(*d*) If the assessor or assessors should determine that its probable cost will exceed the outlay stated in the instructions, or the estimate of the competitor should no outlay be stated; provided always that should the assessor or assessors not have been consulted in the first instance respecting the cost, as recommended in paragraph (*a*) of clause 2, and should he or they be of opinion that the outlay stated in the instructions is inadequate for the proper execution of the proposed works, the assessor or assessors shall not be bound in the selection of a design by the amount named in such instructions, but the question of cost shall nevertheless be a material element in the consideration of the award;

(*e*) If any of the other instructions are violated.

11. It is desirable that all designs submitted in a competition, except any excluded under clause 9, should, with the consent of their authors, be publicly exhibited after the award has been made, which award should be published at the time of exhibition.

12. The architect whose design may be selected as the best should be employed to carry out the work, and he should be paid in accordance with the schedule of "Professional Practice as to the Charges of Architects" sanctioned and published by the Royal Institute. If no instructions are given to him to proceed within 12 months from the date of the selection, he should receive adequate compensation in addition to the premium (if any) awarded to him. In the event of a part only of his original design being carried out, he should be paid a sum to be agreed upon in respect of the deferred portion, such sum to be merged in the usual professional charge when the completion of the design is proceeded with.

*** *It should be understood that the Royal Institute issues these Suggestions as a guide to promoters where a competition has been decided upon, but not as necessarily recommending the principle of competition.*

* This sentence is new.

† Clauses 3 and 4, as they stand in the existing document, are as follows:—

3.—Every promoter of a competition, and every assessor engaged upon it, should abstain absolutely from competing, and from acting as architect, for the proposed work.

4.—The number and scale of the required drawings should be distinctly set forth, and they should not be more in number, or to a larger scale, than necessary to clearly explain the design. If perspective views be required, it should be so stated; and they should be uniform in scale, number, mode of colouring, &c.

‡ The existing clause reads:

7. In every case the amount of premium or remuneration for the competitive designs should be fixed *by the promoters, acting* under the advice of the assessor or assessors, and should be paid in addition to the usual professional charges for carrying out the work.

§ Clause 9 is entirely new, and the following clauses have been re-numbered.

The Status of the Profession.

At the same meeting Mr. Lewis Solomon has given notice of his intention to move the following resolution:—"That the Institute is responsible for the inferior position of architects as compared with that of other professions, and that a committee be appointed to enquire into the causes of this inferiority of status and to suggest remedies."

New Patents.

The following specifications were published on Saturday last, and are open to opposition until February 12th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—24,062, BOUGHTON AND SMITH, planes for producing channels in wood and other materials. 24,317, SLACK, furnace-grates. 25,215, HEYL-DIA, insulating floor covering. 25,239, BALDWIN, apparatus for breaking, crushing and screening refuse ashes from furnaces. 25,359, DUNCAN AND NEW SUNLIGHT INCANDESCENT COMPANY, LTD., incandescent bodies suitable for use with gas and like burners.

1900.—23, EDMUNDSON, apparatus for the production of acetylene gas for street lamps, &c. 550, SMITH AND PIONEER INVESTMENT TRUST, LTD., bacterial treatment of sewage effluent. 2,364, SOLOMON, fastening door knobs and the like. 2,534, COCHRANE AND COCHRANE, apparatus for driving piles. 3,108 JOHNSON AND WUNDERLICH, arc lamps. 3,127, BERRY, locks and latches. 5,205, BURTLES AND SIGURDSSON, means for automatically turning gas on or off at predetermined times. 13,752, FREYSOLDT, method of and apparatus for purifying sewage and other effluents, especially of municipal drainage systems. 15,901, FONTANELLA, clinometer, level, square, and plumbing instruments. 17,466, ADOLFSSON, acetylene-gas-generating apparatus. 18,071, NEWMAN, appliances to be employed in the opening and closing of fanlights, &c. 18,437, LAKE (*Universal Safety Tread Company*), manufacture of non-slipping treads, paving, &c. 19,608, EUSTANCE AND COLLEY, plaster sheets or slabs for ceilings, walls, &c. 19,646, WOODWARD AND COLLIER, kilns for burning earthenware and other articles. 19,697, GUIMARAES, gas lamps. 19,807, CLARK AND MARPLES, manufacture of trowels. 19,886, GREEN, fasteners or catches for windows, doors, &c. 19,934, WOITTEQUAND, mounting of electric bells. 20,055, LION AND STERN, iron staircase.

The Glasgow and West of Scotland Technical College is insufficiently and inconveniently housed, and a fund is now being raised to erect new buildings at a cost of £150,000. About £70,000 has already been promised.

Law Cases.

Dispute about Extras.—At the Nottingham County Court, before his Honour Judge Masterman, John Hammersley, timber and slate merchant, carrying on business under the style of E. Hammersley and Sons, recently sued John Alfred Catlin, residing at West Bridgford, for the sum of £11 15s. 10d., extras in connection with the building of a greenhouse, and for the erection of a rustic fence.—Plaintiff stated that in July, 1898, he agreed to build a conservatory for the defendant for £42 10s., but subsequently Mr. Catlin desired a hot-water apparatus, a cistern, and a brick floor put in, and also gave orders for a rustic fence to be erected. The claim was for these extras, which defendant had refused to pay.—The defendant alleged that the sum of £42 10s. was to include everything in connection with the greenhouse, and it was expressly stipulated that there were to be no extras. He denied ordering any extras at all. He ordered the rustic fencing, but the price ought not to be more than £6 10s. There were two small items, amounting to 15s. 10d., which were admitted. This brought up the total to £49 15s. 10d., but as £50 had been paid, he was not indebted to Mr. Hammersley at all. Witnesses were called to speak as to the value of the rustic fence, and his Honour gave judgment for plaintiff for £7 10s. with costs.

Frontages: a Scotch Case.—The First Division of the Scottish Court of Session recently disposed of an appeal from the Dean of Guild Court of Glasgow at the instance of John Whyte, Master of Works for the city, in a petition for a lining by Peter Glass, builder, of Glasgow. The petitioner craved the Dean of Guild Court for a warrant to take down existing buildings at 88-94 Rutherglen Road, Glasgow, and to erect in their place two new tenements of shops and dwelling-houses. The Master of Works objected to the lining being granted, as it was proposed to erect the buildings 16ft. from the centre of the road, which is a turnpike road, whereas, by the terms of the Turnpike Roads Act, 1831, section 91, and the Glasgow Police Act, 1866, section 366, the buildings should be erected 25ft. from the centre of the road. The Dean of Guild Court overruled the objections and granted the lining, holding that the Turnpike Roads Act did not apply to the re-erection of buildings on sites on which the existing buildings had been erected prior to the passing of the Act. The petitioner was found entitled to expenses. On December 20th the Dean of Guild's decision was recalled, and the case was remitted back in order that the restriction on the Turnpike Roads Act should be given effect to. The Master of Works was found entitled to expenses to date. The Lord President, in disposing of the appeal, said that section 366 of the Police Act prohibited the Dean of Guild from granting warrant to erect any building except a stone wall, not exceeding 7ft. in height, within 25ft. of the centre of the Rutherglen Road. He, therefore, thought that the interlocutor of the Dean of Guild should be recalled, and the case remitted to him to give effect to the restrictive provision contained in section 91 of the Turnpike Roads Act of 1831. The distance mentioned in section 366 of the Police Act was applicable to turnpike roads, and required 30ft. to be left, but there was a provision at the end of the clause to the effect that a building might be erected at a less distance. He, therefore, thought that a building might be erected 25ft from the centre of the road without contravening section 91 of the Turnpike Act.

An Important Right of Light Case.—In the Chancery Division of the High Court of Justice on December 21st Mr. Justice Joyce gave judgment in the case of the *Home and Colonial Stores* v. *Colls*. In this action the plaintiffs claimed an injunction to restrain the defendant, J. H. Colls, from erecting on the site of 44 Worship Street, E.C., any building or erection so as to darken, injure, or obstruct any of the ancient lights of the plaintiffs as the same were enjoyed previously to the taking down of 44 Worship Street. The facts sufficiently appear from the following judgment of Mr. Justice Joyce:—The plaintiffs are entitled for the residue of a term, having about 17 years unexpired, to a considerable block of buildings situated on the east side of Paul Street, at the corner between that street and Worship Street, which runs westwards from Paul Street, so that the plaintiffs' building has a west front to Paul Street and a south front of about 150ft. in length to Worship Street. Worship Street is a tolerably broad thoroughfare, being 41ft. or thereabouts across. Opposite a portion of the south front of the plaintiffs' premises in Worship Street is the site of some buildings recently removed, which is about 36ft. in width and numbered 44 in the street. The buildings which formerly stood on this site were 19ft. 6in. in height, and the defendant has entered into a building agreement to erect on this site a building which, if and when completed, would be 42ft. in height. On the west of the defendant's premises and at the corner between the south side of Worship Street and the east side of Wilson Street there is a public-house 33ft. in height, and none of the buildings in Worship Street on the east of the defendant's premises exceeds that height. It is, I think, tolerably clear, and I find as a fact, that the defendant's building if erected to the height of 42ft. as proposed would not materially interfere with the access of light to any window on the first floor of the plaintiffs' premises, or with any light to which the plaintiffs are entitled in respect of their basement. The real and only question, in my opinion, is with respect to apprehended injury to the third and fourth windows—counting from Paul Street—on the ground floor of the plaintiffs' building. These windows are of large size, but, although the top light is said to be the most valuable and important, the uppermost part of each of the windows is filled with coloured glass to a depth of 20in. from the top, and there are wire blinds fixed at the bottom of each window. The portion of the ground floor of the plaintiffs' building which is opposite the defendant's premises is used as an office. It consists of a large room 11ft. 10in. high and of unusual depth, the back wall being upwards of 50ft. from the Worship Street front, and it has no window nor source of natural light at the back. This room contains several desks used by clerks in the employment of the plaintiffs for the purposes of their business. It is fitted with electric light, there being five rows of lamps in or near to the ceiling and arranged parallel to Worship Street. It is, I think, the result of the evidence that it has ordinarily, if not always, been the custom to use the electric light in the back part of the room, and it would require a most extraordinary amount of light from the windows in Worship Street to enable such use of the electric light to be dispensed with even on ordinary days. Practically, I think it may be assumed that the use of electric or some other artificial light is now, and must always be, necessary in order to illuminate the back part of the room even in the day time. There is no evidence to show that any such extraordinary amount of light from the Worship Street windows has been enjoyed or required for anything like the period of twenty years. Probably the ground-floor rooms in the plaintiffs' premises were reconstructed or rearranged as they now are within quite a recent period. Various expert witnesses were examined, and as the result of their evidence I am of opinion that the proposed new building of the defendant would not affect the selling or letting value of the plaintiffs' premises. If erected to the proposed height of 42ft. no part of the defendant's building would be high enough to reach any line drawn at an angle of 45deg. to the horizon from any point in the base or sill of either of the windows in question belonging to the plaintiffs. But the defendant's building would, for its width of 36ft. directly south of these windows, cut off a portion of the sky area now visible from within the plaintiffs' office, and it would, I think, to some extent necessitate, more frequently and during somewhat longer hours than at present, the use of artificial light in the front part of the office. It is practically admitted that the defendant's building might be raised a certain height—the plaintiffs' principal witness said to a total height of 25ft. from the ground—without any material injury to the plaintiffs. Apart from any question with respect to the back part of the plaintiffs' premises and to the extraordinary amount of light required (if it could possibly be obtained) therefore in the absence of illumination by artificial light, the plaintiffs' premises would still, in my opinion, after the erection of the defendant's building be well and sufficiently lighted for all ordinary purposes of occupancy as a place of business. If they were of only ordinary depth, they would have amply sufficient light—at present they have abundance of light, and in fact are, in my opinion, unusually well lighted. If, as was contended on their behalf, the plaintiffs are entitled to the full amount of light now enjoyed without appreciable diminution, they would have a good cause of action upon the erection of the defendant's building, though it may perhaps be doubted whether the diminution of light that would result would be sufficiently serious to entitle the plaintiffs to an injunction. In my opinion it is not possible to reconcile the numerous authorities that were cited before me in the arguments of counsel. But the defendant insists upon the most recent decision—namely, that of Mr. Justice Wright in the case of *Warren* v. *Browne* (1900, 2 Q.B., 722), and, after considerable hesitation, I have come to the conclusion that that decision, if it is not reversed by the Court of Appeal, ought to govern the present case, and I think that, sitting as a Judge of first instance, I am bound to follow it. Assuming, therefore, that I am right in this view, I am of opinion that this action fails and must be dismissed with costs.

Builders' Notes.

At the Bournemouth and District Master Builders' and Decorators' Association's annual meeting Mr. George McWilliam was elected president.

American Cement.—The Atlas Cement Company, one of the largest concerns of its kind in America, recently broke all records by turning out at its plant at Northampton, Pa., 15,000 barrels of cement in a run of twenty-four hours. The plant is now in course of enlargement.

For Using Improper Mortar in building houses in Sidney Road, Leyton, at Stratford Police Court Charles White, builder, of Warren House, Leyton, was summoned. For the defence it was stated that the inferior mortar was used owing to a labourer's oversight. The wall had since been pulled down and properly rebuilt. Defendant was fined £5 and costs 7s. 6d.

Building at Woking.—There is a great demand for houses at Woking, and estates are being sold up rapidly, affording excellent opportunities for speculative building. Messrs. Alexander H. Turner and Company, auctioneers, of 199 Piccadilly, W., will sell at the Mart on the 16th inst. a freehold building estate, comprising 72 acres, on Church and Kettlewell Hills, Horsell, with frontages to the main road to Chobham and to Horsell Common, on gravel and sand, with gas, water and electric light mains close at hand.

Building in Hull.—A slump in the building trade in Hull seems to have commenced in earnest. There are now two firms in the Bankruptcy Court, the creditors of whom met the other day. In one case in particular a most unsatisfactory state of affairs was disclosed, no doubt largely attributable to the "financing" system under which those firms seem to have been nurtured. Within the last year or two, helped possibly to some extent by the builders' strike, there have sprung into existence a great number of small firms who commenced operations with practically no capital of their own, but who got land first of all on mortgage, and were enabled to build by the aid of financiers, who advanced them money according to the progress of the building. The only chance of getting anything out of the transactions is by a favourable sale of the equity, and this has not always turned out a very large item after all expenses have been paid. The least little depression and the difficulties of these small firms are increased tenfold. When one of these firms has to pay about nearly one-tenth of the value of the houses in arranging the mortgages it will be seen that their position is not a very stable one.

Professional Practice.

Burton.—The Primitive Methodist Chapel in Wetmore Road is being enlarged. The chapel is to be increased in length, and additional seating accommodation will be provided for 50 persons. A front entrance porch is to be built, and an inner lobby formed, the upper portion of which will be glazed with amber cathedral glass. The buildings at the back of the chapel will comprise on the ground floor a minister's vestry and class-room, kitchen and accommodation for the boys and girls attending the Sunday schools, and on the first floor will be two class-rooms. The chapel will be heated with a powerful stove, and the class-rooms with open fire grates. The existing front of the chapel is to be remodelled; the old windows are to be taken out and substituted by three new ones, having stone quoins, arches, mullions and tracery heads, the centre being a four-light, with a cusped and quatre-foiled tracery, with two side lights. The gable will be taken down, and rebuilt with panelled and cusped stonework and stone copings. The glass used in the windows will be of a rich amber tint, leaded in plain ecclesiastical designs set into the framework without wood frames. The ventilation of the chapel is secured by inlet panels, and a powerful air outlet pump is fixed on the ridge of the roof. The buildings have been designed by Mr. Thomas Jenkins, architect, and are in the early English Gothic style. The general contractor is Mr. J. Harlow, the stonemasons being Messrs. Parker and Stamp, of Dallow Lane.

Edinburgh.—A new Board school is to be erected facing Ashley Terrace, North Merchiston, and will contain one and a quarter acres of ground. The main feature of the plan is a central hall both on the ground and on the first floor, with class-rooms grouped round them on each floor, the ground floor being devoted to the infant department, and the first and second floors to the juvenile department. The second floor will contain, besides the ordinary class-rooms, a combined workshop and cookery class-room and gymnasium. The class-rooms contain an average number of 60 pupils, and there being 27 class-rooms in all, accommodation is provided for 1,586 pupils. The school has been designed in a simple treatment of English Renaissance, the windows lighting the juvenile hall on the first floor being marked by semicircular heads. An ornamental belfry surmounts the central floor. The building will be heated by means of hot-water pipes on the low-pressure system. Ventilation is obtained by means of electrical fans extracting the vitiated air from all the rooms. Mr. Robert Wilson, of Queen Street, Edinburgh, is the architect.

Glasgow.—The Executive Committee of the subscribers to the Queen's Diamond Jubilee Fund for the reconstruction of the Royal Infirmary have decided between the various plans sent in by the ten competitors. Dr. Rowand Anderson was the assessor, who placed plans marked F first. A vote was taken, when 8 members voted for plan F, 10 for plan E, and 3 for plan B. Plan B being struck out, its supporters voted on the other two plans, with the result that plan E had 11 votes and plan F 10 votes. The Lord Provost having opened the sealed envelope marked E, the author was declared to be Mr. James Miller, I.A., West George Street, Glasgow. The committee then unanimously appointed Mr. Miller architect for the reconstruction of the Infirmary—the work to be carried out in such manner and to such extent as the committee may from time to time determine. The plan provides for the reconstruction of the whole of the present buildings, adapting them in every respect for the purpose for which they are intended. The cost of the reconstructed buildings is estimated at £224,500. Mr. Miller is also the architect for the Glasgow International Exhibition. The official description of the new buildings states that the arrangement of plan follows very closely the lines of Plan No. 5, issued by the committee to the competitors, and shows a great quadrangle towards Castle Street, 430ft. long by 190ft. deep. The front, or Jubilee, block faces Cathedral Square, and occupies very nearly the position of the Adams front of the present building. This block has a frontage to Cathedral Square of about 216ft., and a prominent and striking feature in this elevation is the great central tower, 32ft. square, rising to a height of 160ft. The distinctly Scottish flavour which characterises the whole design is a marked feature in the tower. At the angles of the tower are circular turrets carried up through the parapet, and from the top of the square tower rises a spire, which, together with the turrets, forms a striking group. The plan is divided into three sections, or blocks, viz., the Medical Block, Surgical Block, and Special Diseases Block. The former is contained in the front, or Jubilee, block, and is six storeys in height, and contains 10 large wards and 20 single wards, accommodating in all 225 beds. In the centre there is a large and well-lighted central hall, extending the whole height of the building, right and left of which are the wards and the various rooms connected therewith. The Surgical Block is placed at the north end of the site, and is six storeys high, and contains 18 large wards of 14 beds each, and 24 small wards containing in all 42 beds, the total number of beds in the Surgical Block being 296. This block is 290ft. long. In the centre, as in the Medical Block, is a great central hall, 40ft. square, with galleries all round, which give access to the corridors. This hall is lighted by a large glass cupola at the top, as well as by side windows on every floor. Grouped round the central hall are the various rooms in connection with this important part of the institution—namely, nurses' room and ward kitchen, outdoor patients' room, day rooms, lavatories, linen rooms, &c. The operating theatre is a large and well-proportioned apartment, 30ft. by 20ft. It is lighted on three sides, the chief light being from the north. Immediately adjoining the operating theatre are the sterilising room, splint room and microscopic rooms, also a recovery room. A special lavatory is provided for the operating staff near to the operating theatre. The Central Block contains the wards for special diseases. On the ground floor are the administrative offices, board room, doctors' and matrons' dining rooms; also a large dining room for 80 nurses at a time. On the top floor of this block are placed the kitchen and other apartments connected therewith. On the top floor is a service corridor, which extends throughout the entire building. Service trolleys, containing food, etc., are run from the kitchen along this corridor to the large service lifts, which are provided in the centre of each block. In each block accommodation is provided for the resident doctor or surgeon on every floor, containing a sitting room, bed room and bath room, with lavatory and w.c. The entire building provides beds for 700 patients. The main elevations, while they have been treated in a simple manner, show a fine sense of massing and proportion; and the outcome of the plan is, as it should be, clearly indicated in the elevations. The great height of the buildings, and their breadth and dignity, is impressive and monumental. A special feature in the design is a flat garden roof on the top of the central block, extending nearly 500ft. in length, with a width of about 32ft., and surrounded by a stone balustrading. This will be laid out with shrubs and seats, and formed into a pleasant airing space for patients. Passenger lifts communicate direct with this airing space, in addition to the staircases. At the immediate front of the great quadrangle, facing and adjoining Castle Street, are the gate-house block and isolation blocks. These buildings are only one storey in height, with stone parapets and flat roofs, so that the view of the quadrangle from Castle Street might be interfered with as little as possible. They are treated in a style in keeping with the main buildings, and, on account of their lowness, help to give scale to the great mass behind. A careful examination of the plans shows that great consideration has been given to obtaining the greatest possible amount of light and air to the various apartments, and especially the wards, and, as far as possible, keeping them free from projecting wings. In this respect the plan differs very much from the usual hospital plan, where the various wards are ranged in parallel blocks at comparatively short distances apart, thereby creating confined air spaces and giving a gloomy aspect to the wards, as the side windows of the ward must necessarily overlook the windows of those adjoining, which tends to have a depressing effect on the patients. In the accepted plan these defects have been to a great extent overcome, all the wards having a free and open outlook. The method of heating and ventilating is the plenum system, whereby the entire building will be heated by means of hot air being forced into the apartments by fans in cold weather, and fresh cooled air in hot weather. The air before being admitted into the building will be washed and purified, so that even in foggy weather nothing but pure air will be admitted, all windows being hermetically sealed. The volume of air forced into the building will be such that the air in the wards and other apartments will be completely changed every six or seven minutes, this process going on continuously. There are six large lifts provided in the building—two in each of the three main blocks—besides which there are several smaller lifts in connection with the kitchen and dining-rooms. All lifts will be controlled by electricity. The buildings will be entirely lighted by electricity, with special movable fittings at the bed of each patient. The style of architecture is based on examples of Scottish Baronial work, as practised in the sixteenth and seventeenth centuries. When completed it will be one of the greatest buildings of its kind ever erected.

Llandaff.—The two side-lights of the triplet of windows in the west front of Llandaff Cathedral have just been filled with stained glass, thus completing the entire suite of the group and that in the gable above. The light on the north side has been erected in memory of the late Dean Williams, who completed the restoration of the edifice. It represents Nehemiah superintending the building of the walls of Jerusalem. Both below and above this panel are large figures of angels, one bearing a model of the church to symbolise the special work of the deceased dean. This window is the gift of Mr. J. P. Seddon, the cathedral architect. The window on the south side has similar angels to those described in the other light above and below a panel, and both are surmounted by rich canopy work, and surrounded by ornamental scroll work, &c. Both these windows are from the designs of Mr. J. P. Seddon, the diocesan architect, of the firm of architects, Messrs. Seddon and Carter, of Cardiff, and have been drawn and executed by Mr. H. G. Murray, of London.

Seaton, Devon.—The ancient parish church of St. Gregory, which is apparently late fourteenth century work, has been reopened after renovation. The works now completed consist of the substitution of an open timbered roof with carved wood bosses at the various intersections in place of the lath and plaster ceiling, whilst the walls throughout have been thoroughly overhauled and ornamented by colour. There are new clergy prayer-desks of oak, and a beautiful new pulpit of carved oak has been set up on the north side. This has been carried out by Messrs. Harry Hems and Sons, of Exeter, who are also making the new font which is not yet fixed. The bowl of this font is of Beer stone, and will be carved upon each of its eight faces, and, when complete, will stand upon alabaster columns resting upon a double row of octagonal steps. The architect of the work is Mr. Strawbridge, of Taunton. The work has been carried out by Mr. H. Abbot, of Seaton.

British Institute of Certified Carpenters.—The annual report and statement of accounts for the session 1900 states that the Institute has progressed very favourably. This year 15 new members have been enrolled, which brings the total now on the books to 123, not including the hon. members. There have been 8 ordinary meetings, 3 council meetings, and 2 special meetings for the revision of rules. The balance sheet shows an income of £57 12s. 5d., including balance for 1899 of £27 12s. 5d., and an expenditure of £32 16s. 4d., leaving a balance of £24 16s. 1d.

Keystones.

A Workmen's Club at Bamfurlong has been erected at a cost of £900.

Messrs. E. H. Shorland and Brother, of Manchester, have just supplied their patent Manchester grates to the new Cottage Hospital at Carnarvon.

Mr. F. R. Pickersgill, a retired Royal Academician, died recently in his 81st year. He was elected R.A. in 1857, and was Keeper of the Royal Academy from 1873 to 1887.

Two Threatened Buildings.—The Fish Market at Minehead, Somersetshire, and the Market House at Godalming, in Surrey, are threatened with demolition. In neither case is there sufficient ground for doing so.

The "Temple," Paris, or old clothes mart, which since the days of Louis XVI. and Jacques Molay has been the central mart for cast-off garments and other domestic frippery, is threatened with demolition. Of late prosperity has not attended the male and female vendors, and many of the stalls are unoccupied.

At Ashill Parish Church two memorial windows have been erected. The one at the east end consists of three lights. The other is on the south side of the chancel, within the sacrarium, and immediately over the piscina, and contains two lights. The new stonework in the windows is by Messrs. Cornish and Gaymer, of North Walsham, and the glass by Messrs. Levers and Westlake, of London. Mr. Arthur Reeve was the architect of the stonework.

Bushey House, in the old Deer Park at Richmond, is to be the future home of the National Physical Laboratory. The rooms are of the wide dimensions befitting a Royal residence, so that no structural alterations will be required beyond the putting in of concrete floors and stands for instruments. A new engineering laboratory will be provided, and a boiler house and engine room erected. The estimate of the Office of Works of the cost necessary to make Bushey House suitable for a laboratory amounts to £14,296, which includes the engine and dynamo for the supply of light and power.

The Foreign Office.—There has lately been placed in Lord Salisbury's new private room at the Foreign Office an interesting series of historical portraits in oils. Among them are the Earl of Bath, the well-known seventeenth-century statesman, by Sir Joshua Reynolds, which has been lent by the trustees of the National Portrait Gallery; Lord Clarendon, the Duke of Wellington, Lord Chancellor Camden (a copy of Sir Joshua Reynolds's canvas), Lord Chancellor Thurlow, in an unfinished state (probably painted by one of the pupils of Sir T. Lawrence); and Spencer Perceval, the Prime Minister who was murdered in the Commons Lobby. The apartment also contains a costly piece of Chinese tapestry, which was presented by a Special Ambassador some time ago. Several additions have also been made to the oil paintings in the new Cabinet Room, including a replica of Angeli's Jubilee portrait of the Queen, Queen Caroline, Charles II., and some of the Georges.

Art in Whitechapel.—The first loan exhibition in the new Whitechapel Art Gallery will be held from about February 22nd to April 15th, this period including the Easter and Passover holidays. About 220 pictures have already been promised, including several by Watts, Burne-Jones, Rossetti, Ford Madox Brown and Gainsborough. The public will have the right of voting for "the three most popular pictures," though as a means of discovering the public taste this system is admittedly imperfect—for many of the most appreciative visitors do not vote at all, and others are so enthusiastic as to come in day after day to vote for their favourite works. Another feature of the exhibition will be lectures given in the gallery by artists and others explanatory of the various subjects; and the catalogue will also be of a distinctly expository kind. The gallery will be open from 10 A.M. to 10 P.M., Sundays included, while the exhibition lasts. £500 is still required for the building fund of the gallery.

A new Prince of Wales' Theatre at Nuneaton is being erected. The architects are Messrs. Owen and Ward.

Mr. Edmund M. Wimperis, vice-president of the Royal Institute of Painters in Water-colours, died on Christmas Day. He was born in 1835.

A Stained Glass Window has been erected in the new Congregational Chapel at Upton. Messrs. Williams Brothers, of The Kaleyards, designed and executed it. The colouring of the window is quiet and effective.

At St. Catherine's Church, Hatcham, a stained-glass window has been unveiled: the subject of the window, which has been inserted in the Lady Chapel, is St. Catherine, the patron saint of the church. The window is the work of Messrs. Simpson and Co., of Charing Cross.

The Market Cross at Inverness has been restored. Since the late Mr. Gladstone restored the Edinburgh Cross fifteen years ago what may be termed a "Market Cross Renaissance" has set in throughout Scotland, and the restoration of the Inverness Cross is one of the most recent renewals successfully carried out. The Old Cross has been placed in front of the Town Hall, the work of restoration including some fine carving work, notably the Scottish Unicorn supporting the Inverness Town Arms.

Memorials to Actresses.—In the Royal Pavilion, Brighton, by Sir Henry Irving, a bust of the late Miss Amy Sedgwick (Mrs. Goostry), an actress whose liberality locally was much appreciated, has been unveiled. The marble memorial of the late Helen Faucit (Lady Martin), which Sir Theodore Martin has presented to the Shakespeare Memorial Buildings, Stratford-on-Avon, has also been unveiled. The memorial was intended for the chancel of the parish church, opposite Shakespeare's monument, but the offer was withdrawn owing to strong protests.

The Glasgow and West of Scotland Technical College Architectural Craftsmen's Society held a meeting on Friday, December 21st last, Mr. Isaac Low presiding. Papers were read on the subject of "Conditions of Contract"—by Mr. James A. Ferguson on joiner work, Mr. Robert Aitkenhead on mason work, and Mr. Isaac Low on plumber work. Deducing the contents of the three papers, the following were the most important of the items commented on. The upholding of work for the customary two years by the contractor was considered excessive, six months to one year being suggested as ample. Arbitration in case of disputes arising in the carrying out of the contract. It was suggested that in conditions wherein disputes were to be referred to the architect, whose decision would be final and binding, this might be more justly dealt with by the appointing of a representative of both the architectural and legal professions as arbiters. The questions of time clauses, extras, after-measurement system, testing of materials, &c., were also discussed.

The Northamptonshire Architectural Society held its annual meeting recently, the Rev. A. W. Pulteney occupying the chair. The Rev. A. K. Pavey and Mr. C. A. Markham were elected hon. secretaries. The Rev. E. L. Tuson was appointed treasurer and Mr. E. M. Brown auditor. Certain alterations to the rules of the society were approved. The chairman, in reply to a question, said it had been thought undesirable to amalgamate with the Northamptonshire Natural History Society. It was decided that the title of the society should be in the future the Architectural and Archæological Society for the Archdeaconries of Northampton and Oakham. The fifty-fifth annual report stated that four members of the society had died during the year and one had resigned; nine new members had been elected during the year. The treasurer's report showed total receipts, including a balance in hand of £18 11s. 2d., of £64 13s. 2d. The expenditure amounted to £48 13s. 6d., leaving a balance in hand of £15 19s. 8d. Both reports were adopted. A paper on "Some Remarks on the Characteristics of North Northamptonshire Churches" was then read by Mr. R. P. Brereton.

Surveying and Sanitary Notes.

Cleethorpes Improvements.—The need for sea defence works and other improvements at the south end of Cleethorpes is receiving the serious consideration of the Urban District Council, whose committee now recommends them to adopt a scheme including the acquiring of the golf links (about 45 acres in extent), the erection of a sea wall, the making of roads, &c., at a cost of between £20,000 and £25,000. A sub-committee has been appointed to confer with the representatives of the Sidney Sussex College, which owns the major part of the land at Cleethorpes.

Tottenham Court Road Improvement.—The City Lands Committee have reported to the Corporation on the question of dealing with the Corporation's property on the east side of Tottenham Court Road. Alfred Place, which is parallel to Tottenham Court Road, has, the committee reports, at its north and south ends, short streets (Chenies Street and Store Street), the houses in which are arranged in the form of a crescent. Such planning was quite out of date, and was to be deprecated for many reasons. The abolition of these crescents was, after some negotiations, approved by the late St. Giles's District Board of Works, and the formation of two new streets, 50ft. wide, had now received the sanction of the London County Council. Alfred Place is to be prolonged northward and southward—on the north to meet Alfred Mews (to be widened to 50ft.), and on the south to meet a new street which runs into Tottenham Court Road, also 50ft. wide.

The Institute of Sanitary Engineers.—At the half-yearly general meeting on December 12th, 1900, the following officers were elected for the year 1901:—*President*: Dr. J. B. Wilkinson, D.P.H., &c., M.O.H. County Borough of Oldham, and Consulting M.O.H. County of Huntingdonshire. *Vice-Presidents*: Dr. Thresh, M.O.H. Chelmsford; Messrs. S. I. Adams, Mem.San. Inst., &c.; H. M. Dove, Assoc.San.Inst., &c.; J. Farley, C.E.; S. Minty, Assoc.San.Inst., &c.; W. J. Wells, M.S.A., Assoc.San.Inst., &c. *Honorary Directors*: Messrs. H. M. Dove, J. Farley, and W. J. Wells. *Council*: Messrs. J. Allan, F. P. Barber, E. Berrington, C. E. Butcher, H. G. Beams, G. H. Carter, E. D. Cecil, W. H. Coltart, T. W. Deadman, C. Dobbs, J. T. Griffin, R. Horton, N. W. Hoskins, A. R. Hutson, J. Jenkins, W. E. Markham, F. W. Mason, T. R. Nash, E. R. Palmer, F. B. Patch, F. J. Rayner, W. Strachan, T. M. Taylor, J. Thompson. *Auditor*: Mr. R. J. Ward, C.A., 2 Clement's Inn, W.C.

Bacterial Treatment of Sewage.—The third report under the London County Council by Dr. Clowes and Dr. Houston on the bacterial treatment of crude sewage has just been issued. The first report dealt with the bacteriological examination of crude sewage as it arrived at the outfalls at Barking and Crossness. The second gives the results obtained by the chemical and bacteriological examination of the crude sewage of the effluent from the coke beds at Crossness. The present report gives a similar statement of the results secured in the experimental bacterial treatment which has been carried out at the northern outfall, Barking, and of the experimental treatment put in force at the southern outfall, Crossness, since the issue of the previous report. As regards the general bacteriological aspect of the treatment of London sewage, Dr. Houston gives a statement of the conclusions at which he has arrived after two years' study. He concurs in the advisability of adopting the bacterial method of treatment of London sewage in place of the chemical treatment, and maintains that under the conditions existing in the lower river and at the outfalls this system would furnish a more satisfactory result. But he states that though the effluent from the bacterial beds would not lead to nuisance in the river, it would be by no means a satisfactory liquid to introduce into a part of the river which was used for drinking purposes.

Engineering Notes.

Electrical Engineer to the L.C.C.—This appointment, which carries with it a salary of £1,000 a year, is open till January 14th.

The Channelling of London Bridge is being repaired without inconvenience to the public, the work being done between the hours of nine p.m. and six a.m. The example thus set by the City Surveyor (Mr. A. Murray) will not, it is to be hoped, be disregarded by the Postmaster-General.

"The Theory of Engineering Construction" is the title of a book by Mr. Ernest H. Essex, A.M.I.C.E., just published by the St. Bride's Press, Ltd., 24 Bride Lane, Fleet Street. Mr. Essex is the assistant engineer and surveyor to the Leyton Urban District Council. The book comprises a selection of notes and formulæ on the theory of construction arranged in the form of answers to the questions set at examinations for the election of associate members of the Institute of Civil Engineers. The price of the book is 5s. nett.

Bridge across the Swale.—The Conservators of Milton Creek, Sittingbourne and the Kent and Essex Brickmakers' Association have definitely decided to oppose the Bill which is being promoted in Parliament by the South Eastern and Chatham Railway Company for the substitution of a fixed bridge over the river Swale at King's Ferry, near Queenborough, in lieu of the swing bridge authorised by the existing powers; as the effect would be to permanently close Milton Creek to all vessels that cannot lower their masts. It is expected that the Sittingbourne and Milton Urban District Councils will support the bodies named in opposing the Bill.

New "Tube" Railways in London.—The following tabulated statement shows the final extent of mileage of the underground electric railways in London constructed, authorised and proposed:—

	Miles.
CONSTRUCTED.	
Central London	5½
City and South London	3½
Waterloo and City	1½
OLD SCHEMES, CONSTRUCTING OR AUTHORISED.	
Baker Street and Waterloo	5
Brompton and Piccadilly Circus	2
Charing Cross, Euston, and Hampstead	5
City and Brixton	3½
City and South London (Moorgate Street to Angel Extension	2
District Railway Deep Level (Mansion House to Earl's Court)	4½
Great Northern and City	3½
Great Northern and Strand	5
Whitechapel and Bow	2
NEW PROJECTS AND EXTENSIONS OF RAILWAYS ALREADY AUTHORISED.	
Brompton and Piccadilly Circus	4
Central London (Extension to Liverpool Street and loop lines)	1
Charing Cross, Euston, and Hampstead Extensions	5
Hammersmith and District	5
City and North-East Suburban	17
City and West End	6½
Islington and Euston	1½
King's Road	2¾
North-East London	11
Piccadilly and City	2
Victoria, City, and Southern	7
West and South London Junction	4½

This is a total of more than 140 miles. Calculated on a basis of £600,000 a mile, which was said to be the cost of the Central London, the capital necessary to construct the new railways will amount to well over £60,000,000; and another million would have to be spent in converting the present Inner Circle Railway into an electric railway.

Oldham Electric Tramways.—The Middleton Road section of these tramways was opened recently. The work was commenced at the beginning of last year and the route has gradients varying from 1 in 10 to 1 in 27. The gauge is 4ft. 8½in. The system of the electrical equipment is the centre under-running overhead trolley. The steel standards are of the side bracket type, with cast-iron ornamental bases and ornamental wrought-iron scroll work and collars designed by the borough engineer. The electrical energy is being supplied by the Electricity Committee of the Corporation from their present power station. A new generating station is under construction, and will when completed be capable of supplying about 20,000 horse power. In addition to the section just opened seven miles of track are already completed, and the electrical equipment is being pushed rapidly forward. The total estimated cost of the whole system, excluding the new power station but including the permanent way, electrical equipment, cars, and car depots, is £400,000. Messrs. Hewitt and Rhodes, of Manchester, are the consulting engineers, and the whole of the work is being supervised and carried out under the direction of the borough engineer and surveyor, Mr. S. A. Pickering, A.M.I.C.E.

ARCHITECTURE IN CORNWALL AND THE WEST.

LECTURING recently at Plymouth on "British Architecture in the Locality," Mr. Edmund Sedding claimed that the art of the great masters or craftsmen of old was the outcome of intense religious fervour, when Europe laboured for one creed. When our churches were richest in imagery and carved work, art received an irrecoverable shock under the chilly influence of Puritanism. Naves of great churches were blown up, and commodious edifices of whitewashed iron erected. Art was swept out of the churches, and the arts and crafts of Britain drifted into a domestic channel. Then it was that the love of art grew less, and Charles Church, Plymouth, and Falmouth Parish Church bore witness to the forlorn state of seventeenth-century art in the West. A century later it arrived at its worst condition. Churches erected at the beginning of this century had been mistaken for a pile of mine buildings. From that time a reaction set in. Religion revived, but art, smothered by indifference and want of exercise, was dead. It remained for future generations to rekindle this love, but it could not be done without religion. During the last twenty years much had been done to pick up the threads of art and build again, not simply for utility, but for beauty also. We could not do better than take a lesson from nature, and combine beauty with usefulness. Mediæval art was developed, not by the aid of books, but from nature. The art of the Greeks was gradually superseded by that of Rome; in the fifth century Gothic art pervaded Europe and the pointed arch became general. Nature told us that this was the more beautiful form, for she terminated her leaves in this manner. In no county, perhaps, did nature and art more closely commingle than in Cornwall. There was no architectural evidence, either in Devon or Cornwall, of Roman occupation yet discovered, nor were there any remains of Saxon art, which was but a childlike development of Roman work. With the Normans, however, England became transformed with splendid cathedrals and churches, of which the Western peninsula contained considerable remains. It was remarkable that the finest doorways of this period were found in England. There was less thirteenth-century, or first pointed, work in Cornwall than in Devon. Of fourteenth-century, or middle-pointed, work both counties had little to show. It was in the fifteenth century that fully four-fifths of the churches were remodelled and enlarged, which entailed the removal of much earlier work. The lecturer showed slides illustrating the various phases of local architecture in the Norman font of Bodmin and St. Feock, and the west front of St. Germans. Exeter Cathedral represented the fourteenth century; the churches of Ottery St. Mary, Plymton, Chittlehampton, St John's-by-Antony, St. Andrew's (Plymouth), St. Mary Magdalene (Launceston), and Lewannick, were partly of fifteenth- and sixteenth-century date. Screen work was universal in old Western churches and cathedrals, but nine-tenths of this beautiful handicraft had been superseded by the preference for plaster and whitewash, under Puritan influence. Remains of old screens at Dartmouth, Altarnum, and Laneast, were also shown on the screen. Incidentally the lecturer made a plea for the sustenation of old thatched cottages, as they were a relic of traditional art in which utility and beauty were combined.

Quarry Notes.

Sale of Granite.—A sale of the sequestrated stock of Mr. Thomas J. Blann, granite merchant, Pittoddrie Street, Aberdeen, was held recently, and fairly good prices were realised for granite, especially for bases. Mr. J. Reid was auctioneer. The principal purchasers were, Councillor Boddie, Mr. Robert Gibb, Mr. Douglas, Mr. Hood, Wick Mr. Hadden, Messrs. Simpson Brothers, Constitution Street; ex-Councillor Robert Simpson; Mr. Cran, Ellon; Mr. Riley, Aberdeen; Mr. A. Morgan, Mr. R. Lawrence, Mr. W. Edwards, of the Nelson Granite Works; the new proprietor of the yard, and others. At the close of the sale of the granite, tools, steel bars, grindstones, and a number of miscellaneous articles connected with the granite dressing industry were sold and realised fair prices.

A Large Gritstone Block.—There was recently lowered from the overhanging quarry at Stancliffe, Darley Dale, formerly the seat of the late Sir Joseph Whitworth, and now belonging to the Stancliffe Estates Co., a solid, absolutely flawless block of fine gritstone, 30ft. long, 13ft. wide, 18ft. thick, and computed to weigh 540 tons. One of the largest blocks of stone ever got locally was also recently blasted at Mr. Robert Simpson's Peasonhurst deep stone quarry, Ashover, about three miles from Darley Station. The block measured 33ft. long, by 31ft. wide, and 23ft. thick, and contained upwards of 23,500 cubic feet of stone, its computed weight being about 1,680 tons. The stone was moved 12in. from its bed by a charge of 40lbs. of powder, in one bore hole, 20ft deep, and was riven into three sections.

Craig Dhü Quarry, situated within ten miles of Creetown, one of the principal granite quarrying centres in the south of Scotland, has been opened by the North British Granite and Whinstone Company, Ltd. It is said that the supply of good rock in that locality is practically inexhaustible, but the facilities for dispatch are not as good as they are at some of the other quarries in the vicinity of Creetown. This, however, may be improved. Creetown stone is one of the finest granites for close-axed work that can be obtained in the United Kingdom. It is light grey in colour, close grained, and resembles the silver-grey granite of Kemnay, Aberdeenshire. When fine-axed it looks like marble, and in polished work it forms an excellent contrast to the dark Swedish or deep blue Russian granites. Orthoclase appears in the form of grey irregular crystals, while plageoclase is fairly abundant, and in characteristic striated layers. The quartz is in the form of clear glassy masses, and the mica is almost wholly of the biotite variety.

A Masonry Dry Dock at San Francisco is to be built 750ft. long from gate seat to coping at head, 122ft. wide at coping, 74ft. wide at the bottom, and 32½ft. deep from coping to sill. The facing of sides of the approach, seat for caisson, and gate arch will be of cut granite. The dock will have eleven altars at top and five at bottom, from a point 100ft. from the gate seat to within 150ft. of the head of the dock. The keelson will be 4ft. wide. Transverse sills of 12in. by 12in. timbers must be laid on both sides of the keelson, 10ft. apart, from apron to head of dock. Bilgeways must be located at these sills. The walls will be of concrete, backed with dry yellow clay, well puddled and tamped, but the top 18in. will be rock filling covered with a macadam surface. The concrete is to be composed of one barrel of Portland cement to 20 cub. ft. of broken rock and 5 cub. ft. of sand. For the altars the proportions will be one barrel of cement, 18 cub. ft. of rock, and 4 cub. ft. of sand. The walls will be anchored to the rock stratum by posts of 60lb. flange rails, 10ft. apart let into the rock and embedded in the concrete. The concrete facing of walls, altars, &c., will be strengthened by a web of expanded metal of No. 18 gauge steel, about 50,000 sq. ft. of this being required. The altars will be extra well tamped, the corners and angles moulded, and the treads and risers plastered with a mortar of sand and cement 1 to 1. The keelsons and transverse sills will be secured to the rock by anchor bolts, 6ft. long, 6ft. apart, the holes being grouted with lime-stone.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
	BUILDING.		
Jan. 4	Bowness—Residences..	T. Harrison	R. Walker, Architect, Windermere.
„ 4	Fersfield, near Diss, Norfolk—School and Residence, &c.	School Board	H. Winkworth, 3A Hatton Court, Ipswich.
„ 5	Halifax—45 Houses		R. Horsfall and Son, 22A Commercial Street, Halifax.
„ 5	Larne, Ireland—Painting and Repairs at Town Hall ..	Urban District Council	W. G. Younge, Clerk, Council Chamber, Town Hall, Larne.
„ 5	Pickering, Yorks—Vicarage, Stable, &c.		J. Kirk and Sons, Crown Hotel, Roscdale Abbey.
„ 5	Holt, Denbigh—Alterations, &c. to Police Station ..	Denbigh County Council	Police Station, Holt.
„ 5	Mytholmroyd, Yorks—Stables and Coachman's House..		T. H. Healey and F. Healey, 42 Tyrrel Street, Bradford.
„ 5	Mytholmroyd, Yorks—Vicarage		T. H. Healey and F. Healey, 42 Tyrrel Street, Bradford.
„ 6	Siddick, Cumberland—Schools	Workington School Board	Donald and Tate, 14 John Street, Workington.
„ 6	Llandrindod Wells—Alterations, &c., to Hotel		R. W. Thomas, Architect, Llandrindod, Wells.
„ 7	Eastbourne—Chimney Shaft	Electric Lighting Committee	Borough Engineer, Town Hall, Eastbourne.
„ 7	Halifax—Masonry to Bridge	Improvements Committee	J. Lord, Borough Engineer, Town Hall, Halifax.
„ 7	Beeston Hill Leeds—Church and School	Primitive Methodist Connexion	W. G. Smithson, 13 Bond Street, Leeds.
„ 7	Rochford—Isolation Hospital	Rural District Council	C. and W. H. Pertwee, Architects, Chelmsford.
„ 8	Glanamman, Carmarthenshire—Station Buildings ..	Great Western Railway Company	Engineer, Neath Station.
„ 8	Halifax—Five Houses		R. Berry, Architect, Commercial Street, Halifax.
„ 8	Salford—Shed Roof	Lighting and Cleansing Committee ..	Superintendent, Wilburn Street Depot, Salford.
„ 8	Whitby—Esectric Light Station and Destructor ..	Urban District Council	W. S. Gray, Clerk, Council Offices, Whitby.
„ 9	Heamoor, Cornwall—Mixed School	Madron School Board..	O. Caldwell, Architect, Penzance.
„ 9	Stockport—Tramcar Shed, Workshops, &c.	Tramways Committee	A. Atkinson, Borough Surveyor, St. Petersgate, Stockport.
„ 9	Manchester—Roof over Laundry, &c.	Baths, &c. Committee	City Surveyor, Town Hall, Manchester.
„ 10	Kilkenny—Supply Bricks and Slates	Guardians	K. Comerford, Clerk, Kilkenny.
„ 10	Low Row, Yorks—Wesleyan Chapel		Secretary, Chapel Building Committee, Kearton, Reeth, Yorks.
„ 10	Sandbach—Shop Fittings, &c.	Co-operative Society, Limited	A. Price, Architect, Elworth, Sandbach.
„ 10	Lambourn, Berks—Fire Engine House	Parish Council..	H. J. Maberly, Clerk, Market Place, Lambourn.
„ 10	Cricklade, Wilts—Police Station	Standing Joint Committee	C. S. Adye, County Surveyor, County Offices, Trowbridge.
„ 10	Mawgan, Cornwall—Dwelling-house		Miss Tom, Fair Street, Colomb.
„ 11	Dalton-in-Furness—Building Wall	District School Board	Clerk, 68 Market Street, Dalton-in-Furness.
„ 12	Maldon, Essex—Coach House and Stables		P. M. Beaumont, Architect, Maldon.
„ 12	Maldon, Essex—Alterations to House	C. W. Bunting..	P. M. Beaumont, Architect, Maldon.

Deal Potteries, Limited.

This company was registered on December 13th, 1900, with a capital of £5,000 in £5 shares (200 preference) to take over the business of brick and tile manufacturers, clay workers, potters and manufacturers of and dealers in terra-cotta and sanitary ware, carried on by Dorrington Boyle at Deal, as the Deal Terra-Cotta Works. The first directors (to number not less than three nor more than five) are E. Chitty, E. S. G. Warren, F. W. Hardman, and Dorrington Boyle (managing director and secretary). Registered office: Western Road, Deal, Kent.

Masters and Men.

The Northern Lock-out.—The bricklayers at Blyth have been locked out by the Blyth Master Builders' Association in support of the Newcastle master builders in their dispute with the bricklayers. The bricklayers affected number about seventy. A number of labourers and others are also idle. The Master Builders' Association at Middlesbrough have also joined the master builders connected with the Northern Counties Federation in locking out the bricklayers in their employ. About fifty or sixty bricklayers are affected. The attitude of the master builders at Middlesbrough has caused much unfavourable comment in the town, as they held a meeting a few weeks ago, and decided that as they were on excellent terms with their workmen, and had a Conciliation Board which settled all disputes between them, they declined to join in the lock-out by the master builders of Newcastle and other places in the North. It is now stated that the Middlesbrough master builders, who are members of the Northern Counties Federation, are bound to support any action taken by a two thirds majority of the Federation, and such majority was obtained. The Middlesbrough members had, therefore, no alternative. The men's association, it is stated, intend to consider the question of taking or contracting for work, so as to give employment to the hands compelled to be idle. The Lancashire and Cheshire and North Wales Building Trades' Federation have also unanimously decided to support the Newcastle employers. The effect of this decision is that if necessary the operatives over the area, including Manchester, Salford, and surrounding towns, shall be locked out. The committee has power to proceed with the arrangements for a lock-out when the situation requires it without taking a further vote. Nothing, however, is likely to be done in this direction for a few weeks yet.

CONTRACTS OPEN.

COUNTY OF WILTS.
STANDING JOINT COMMITTEE.

Builders disposed to CONTRACT for the work of BUILDING a COUNTY POLICE STATION at Cricklade, in the County of Wilts, for the Standing Joint Committee, can see the revised plans and specification at the County Offices, Trowbridge, between the hours of HALF-PAST NINE a.m. and FIVE p.m.

Copies of the revised bill of quantities can be obtained from the County Surveyor, on written application, accompanied with a deposit of £1 1s., which will be returned on receipt of a bonâ-fide Tender.

Sealed Tenders, endorsed "Tenders for County Police Station, Cricklade," may be sent to the County Surveyor on or before the 10th day of JANUARY, 1901, but no pledge is given to accept the lowest or any Tender.

Builders wishing to view the site can do so by application to the Police Inspector at Cricklade.

CHARLES S. ADYE,
County Surveyor.

County Surveyor's Department,
County Offices, Trowbridge,
December 1900.

THE COUNCIL of the METROPOLITAN BOROUGH of FULHAM hereby give notice that they will be prepared at their meeting to be held on WEDNESDAY, the 9th JANUARY, 1901, at SEVEN p.m. to receive TENDERS for MAKING-UP and PAVING FOOTWAY and STRIP of CARRIAGEWAY of Dawes Road (Sec. I.)

Plans and specifications of the works may be seen and any information obtained from Mr. CHARLES BOTTERILL, Surveyor.

The contractors are to attend personally or be represented at the Council meeting to deliver their own Tenders, together with a £10 note and a schedule of prices, upon which the value of any extras or omissions shall be based, and to make a declaration that they pay the union rate of wages, observe such hours of labour as are generally accepted as fair in their trade, and that all unskilled labour shall be paid the minimum wage of sevenpence per hour.

The Council do not pledge themselves to accept the lowest or any Tender.

W. J. H. DENSELOW,
Acting Town Clerk.

Town Hall, Walham Green, S.W.

METROPOLITAN ASYLUMS BOARD.
TO BUILDERS.

The Metropolitan Asylums Board invite TENDERS for the ERECTION of a SCHOOL for CHILDREN at Swanley, Kent, according to drawings, specification, articles of agreement, and schedule of conditions, which may be seen at the Offices of the Architects (Messrs. NEWMAN and NEWMAN), 31 Tooley Street, London Bridge, S.E., between TEN and FIVE. Bills of quantities, prepared by Messrs. W. H. and P. B. STRUDWICK, may be obtained at the Office of the Architects, as above, upon payment of a deposit of £10 in gold or Bank of England notes, which amount will be returned to persons sending in a bonâ-fide Tender. Tenders, sealed and endorsed, "Tender for Erection of White Oak School," and accompanied by original priced bills of quantities in separate sealed packets, must be delivered at the Office of the Board, Embankment, E.C., not later than TEN a.m. on WEDNESDAY, JANUARY 30th, 1901.

The Board do not bind themselves to accept the lowest or any Tender.

By order.
T. DUNCOMBE MANN,
Clerk to the Board.

December 1900.

HORNSEY URBAN DISTRICT COUNCIL.
TO SEWER CONTRACTORS AND OTHERS.

The Hornsey Urban District Council are prepared to receive TENDERS for the CONSTRUCTION of about 3,500ft. run of BRICK STORM-WATER CULVERT varying from 3ft. to 6ft in diameter, and about 550ft. run of 12-in. STONEWARE PIPE SEWER with Bellmouths, Side Entrances, Manholes, &c., at Hornsey (from the foot of Muswell Hill, along Priory Road, through Rectory Grounds to Pembroke Road).

Plans and specifications may be seen, and copies of the quantities and forms of Tender and all information obtained, on application to Mr. E. J. LOVEGROVE, Engineer to the Council, at the Offices mentioned below, on any morning between the hours of TEN and TWELVE o'clock, on a sum of £2 being deposited with the Clerk to the Council, which sum will be retained by the Council, and deemed to be forfeited if a bonâ-fide Tender is not made by the depositor.

If a Tender is made which is not accepted, the sum deposited will be returned, and if a Tender is accepted, such sum will be retained by the Council until the Contract has been executed by the depositor, and will be forfeited in the event of his or his sureties failing or neglecting to execute such Contract, or the bond accompanying the same, within seven days after he or they respectively shall have been requested to execute the same.

No Tender will be considered except on the prescribed form. Sealed and endorsed Tenders are to be delivered or sent by post so as to be deposited in the Tender box in my department not later than FOUR o'clock p.m. on MONDAY, the 21st day of JANUARY proximo. The quantities, duly completed, must accompany the Tenders.

The Council reserve to themselves the right to decline all or any of the Tenders so sent in.

By order,
F. D. ASKEY,
Clerk to the District Council.

An Architectural Causerie.

Overloaded Floors. AN accident occurred in London last week which serves to draw attention to the very great danger of overloading floors in workshops, factories, and similar buildings. The accident in question happened on the first-floor of some premises in Gunpowder Alley, Shoe Lane, which have recently been acquired by Messrs. Eyre and Spottiswoode. This floor suddenly gave way, killing one man and injuring two others. The building is practically a new one and there appears to be no other reason to account for the catastrophe than that too much weight was put on the floor. In this case the floor was subjected to a weight of 20 tons, and one of the girders having a span of about 15ft. snapped in the middle across the bolt holes. If there is one place more than another where such overloading has to be guarded against it is on the landings of iron staircases; and this is particularly applicable to premises used by printers, who continue to pile up their "formes" till the aggregate weight on the floor is enormous. Cast-iron staircases, it must be remembered, give very little indication of collapse; the last straw, metaphorically speaking, accomplishes the feat, and then we have the coroner's warning, or perhaps his censure. But the men have been killed by that time, and what is required to be done is to see that materials or articles are not piled up on floors in the needless and ignorant manner so common nowadays. There should be a thorough, periodical official examination to enforce this requirement.

A Fen Church. WHAPLODE PARISH CHURCH, in Lincolnshire, is described by its historian, Mr. W. E. Foster, as the finest and most interesting of the Fen churches. Latterly, however, it has been disfigured by a chancel which, in the words of the vicar himself (the Rev. J. W. Rhodes), is an "unutterably mean erection." The Rectors of Whaplode are responsible for this. They were bound by covenant to repair and maintain the chancel and all the buildings on the glebe, but, instead, they have destroyed the ancient chancel and wiped away the buildings on the maintenance of which their right to hold the title depends. To quote the vicar again, the chancel which has been built to their authority is "a wretched thing, a disgrace to them, a disfigurement to the noble church to which it is attached, and an eyesore and a soul-sore to every faithful child of God who loves His house and glory." This is a strong censure, but it is well deserved. The way in which many fine old churches in different parts of the country have been treated is disgraceful; two extremes are generally arrived at—the buildings are either allowed to go to rack and ruin or some nabob or other misguided person "restores" them out of all semblance to their former selves. The vicar of Whaplode Church is now zealously advocating a scheme for the rebuilding of the chancel, a work which is estimated to cost £3,000. The late Mr. Pearson measured the building with a view to making drawings, and there is no reason why, if the rebuilding were placed in such sympathetic and trustworthy hands as his were, the scheme should not be quite successful.

Across London. AT the present time the facilities for travelling from one part of London to another are most inadequate. Suppose, for instance, a person wished to go from Somerset House to Hampstead, or from Battersea to the Bank, think of the long journey by omnibus and tramcar which would be necessary. The Central London Railway has shown that rapid travel underground can be made most comfortable, and the success of this line has promoted the numerous proposals for new underground railways mentioned in our last issue. But the chief feature about these is their utter "singleness"; there is no suggestion of intercommunication between them, though this is, of course, most requisite if matters are to be improved. As Mr. Twelvetrees points out in the "Times," it would be a good thing if a Royal Commission of experts were appointed to systematise the transport facilities of the metropolis, and to formulate some practical solution of a most difficult problem. Such a commission was appointed by the State Legislature of Massachusetts to deal with the traffic of Boston and it effected most satisfactory results; the Paris Metropolitan Railway is the first instalment of a complete system, as is also the underground line in the comparatively insignificant city of Budapest. Unless some sort of systematic control is exercised, the public will never have half the facilities for travelling about London that most certainly should be provided.

EAGLE HOUSE WIMBLEDON · THE GARDEN FRONT.
MR. JACKSON'S HOME.

T. G. JACKSON, ARCHITECT.

Mr. Jackson's House. THE house of Mr. T. G. Jackson, R.A., at Wimbledon, illustrated on this page, is a characteristic piece of work. The variety in the treatment of the details and the refinement and restraint displayed in the whole design at once stamps it as the work of a true artist. This refinement of detail is especially noticeable in Mr. Jackson's most representative work at Oxford: he knows how to get interest by varying the design of bosses and crestings and he is careful about such apparently unimportant points as the width of the leads in his glass-work and the fittings and fastenings generally. Mr. Jackson was born in 1835 and he is consequently just entering his sixty-sixth year.

RAMSAY HOUSE.

SOME SKETCHES BY W. BEVAN.

THE easy acceptance which has established the inexact saying that the site of our National Gallery in Trafalgar Square is the finest site in Europe seems to justify the statement that Ramsay House, Edinburgh, occupies the finest site in the British Isles. As the Trafalgar Square site claims a Classic building, so does the Edinburgh site demand a building designed in sympathy with the Gothic sentiment; but while few people would consent to the National Gallery being considered adequate for its important institution, or fitly availing of the opportunities afforded by the site, there are few who pass along Princes Street in Edinburgh without a full satisfaction and pleasure at the picturesque cluster of buildings which soring upward out of the steep grass-covered slopes of the Castle hill above them. It should be made clear to those who do not know Edinburgh what position the building holds in a city the natural configuration of whose site and the traditions and culture of whose inhabitants have made second to none in the world for stately romantic beauty.

Edinburgh, if we disregard the widespreading suburbs which are springing up upon all sides, may be described are being laid out in two divisions, which by a strange coincidence are as distinct in social style and in the character of their architecture as they are in locality. Each of these divisions is built upon a hill which is separated from its neighbour by a considerable depression with steeply-sloping sides. This valley, which was once filled by a lake—the S. Mary's Loch of history—and is now laid out in public gardens, is traversed by a bridge and an embankment known as the Mound, and the green grass rolls between the two. The hill upon which Ramsay House stands is occupied by the Edinburgh of mediæval days and rises in a sloping ridge which culminates in the famous Castle Rock whose sides fall away in rugged precipitous masses into what were once the waters of the S. Mary's Loch, above referred to. Ramsay House stands conspicuously out upon the face of this ridge, where it rises steeply towards its rocky summit; it forms the outermost and most lofty corner of the old town, and looks out and downward across the valley to the wide Boulevard of Princes Street on the opposite side, along which the restrained stone frontages of the middle of last century are, alas! giving place to florid shop fronts and the gewgaw of modern hotel and commercial architecture.

Ramsay House is so called after Allan Ramsay, the author of "The Gentle Shepherd," who built himself a house on this spot which still forms the nucleus of the group of buildings; it is distinguished in the plan shown on page 434 and may be identified in Mr. Bevan's sketches by the wide bay which characterises its front. The name of Allan Ramsay, though it may recall little or nothing to the Englishman who does not happen to be a student of literature, is familiar to all Scotsmen, and is a household word in Edinburgh, where Ramsay remains one of the most conspicuous figures in the traditions of literary and social Edinburgh. Ramsay was born in Lanarkshire in 1686. His poems, mostly printed as broad sheets, became widely known among all classes, when at the age of thirty he gave up his trade of wigmaking and became a bookseller, at the same time starting the first lending library ever opened in Scotland. The innovation gave rise to strong objection, and the magistrates tried to put an end to the library, but without success. He published several volumes of poems, and then in 1825 there appeared his "Gentle Shepherd," which established his fame upon a sure footing. He became a conspicuous citizen, and having made a comfortable competency he decided twelve years before his death to retire from literary activity, although he kept his shop going till near the end of his life. It was at the time of this "retirement" that he built himself the octagonal villa which has given his name to the block of buildings illustrated by Mr. Bevan in these pages. The house was the subject of a good deal of clumsy banter and ridicule, which Ramsay seems to have resented. Many trivial stories, tiresome and without point to those to whom the name of Ramsay does not recall familiar scenes, personalities, and associations, are told in this connection. One of them is that his house was likened to a goose-pie, by reason of some conspicuous quality of the roof which suggested the relation; and it is told that on Ramsay complaining of the injustice of this comparison to Lord Elibank, his Lordship replied: "Indeed, since I see you in it, I think the wags are not far wrong." This was said 150 years ago, and is still considered a famous joke in Edinburgh.

It must be remembered that in Ramsay's day the whole of the eighteenth-century Edinburgh was undreamed of, and the bow windows of Ramsay House looked northward to the Forth over the wide open country. Grant, in his "Old and New Edinburgh," thus describes the house at this time. "Apart from the city embosomed among trees—and though lower down than the reservoir, yet perched high in the air—upon the northern bank of the esplanade stands the little octagonal villa of Allan Ramsay, from the windows of which the poet could enjoy the extensive view of all the fields, farms, and tiny hamlets that lay beyond the loch below, into the vast panorama beyond the Firth of Forth, with the hills of Fife and Stirling." Ramsay died in 1757, and saw none of the great projects planned by James Craig in 1767, which were to grow into accomplished fact beneath his windows. He was buried in the Greyfriars Churchyard, and in more recent years an iconic statue to his memory has been set up in Princes Street Gardens. The poet's house passed to his son Allan, who became an eminent portrait-painter in London. He enlarged the house, and also erected the extensive buildings to the eastward, known as Ramsay Gardens. He died in 1784, after which the property passed in turn to his son, General John Ramsay, from whom it passed out of the family. Of

RAMSAY HOUSE, EDINBURGH, FROM ESPLANADE. DRAWN BY W. BEVAN.

late years the whole block of buildings has been in use as lodgings for the students at the university, and a large part of the buildings as now existing and shown in Mr. Bevan's sketches is, I believe, due to the skill and taste of Mr. Sidney Mitchel, architect, of Edinburgh.

The Pan-American Exposition.

THE Pan-American Exposition, to be opened at Buffalo, New York, on May 1st next, is the first big experiment in the United States in civic buildings embodying certain new ideas of modern architecture. The Pan-American buildings will be the first working-out on a large scale of certain ideas of modern Renaissance in architecture. Renaissance will be used as the only defined style that could be used to adequately express the desire for richness of detail, permitting, by the variety of its forms, interpretation of the individuality of buildings, and allowing by its lack of definition (in a classical sense) the possibility of suggestive treatment; besides, it is appropriate to the style of the exhibition — that is, Pan-American—since the architecture of South America and Mexico is virtually Spanish Renaissance.

The idea of the Pan-American Exposition is, generally, to carry on the good work of commercial and industrial exhibitions, and it will give the smaller states of South and Central America a chance of showing that they are no longer provincial countries. With the exception of the Horticultural Building space is given free. The site, consisting of 350 acres, of which 133 acres are improved park-lands, is in Buffalo's beautiful Delaware Park. Ground was broken at the end of 1898, and by now most of the buildings have reached their full height, and the grounds are well mapped out. The characteristic of the scheme of the Exposition will be, besides the embodiment of the ideas of modern Renaissance, the introduction on a lavish scale of colour and sculpture, not as adjuncts, but as complementary factors in an architectural whole.

To ensure harmony of work, general schemes, as decided by the Directors and the Board of Architects, were put in the hands of Messrs. Carrère and Hastings, Karl Bitter, and C. Y. Turner, as head architects, sculptor and colourist. At first every member of the Board of Architects was asked to submit a block-plan, in which competition the plan that Mr. John M. Carrère offered was considered the best. It was, however, given to Mr. Peabody, of Peabody and Stearns, of Boston, to complete. Mr. Peabody's plan had been the most like that of Mr. Carrère's. It was later decided that Mr. Carrère should have entire supervision of the block-plan, though accepting certain changes suggested by Mr. Peabody, and for more than a year the work has gone on under Mr. Carrère's management, including all the landscape gardening and the landscape architecture, with many important constructions, such as the monumental entrance bridge. The different buildings were assigned to different architects of reputation in New York and New England, their work being supervised by Carrère and Hastings and the Board of Architects. In the same way the work in decorative sculpture has been going on under Mr. Bitter, while the colour-scheme has been worked out entirely in the studio of Mr. Turner.

It was thought best not to depend for the general effect upon natural surroundings more than to the extent of giving the buildings an advantageous position on top of the high ground beyond the wooded land of Delaware Park. The making of the Exposition a complete composition in itself has been followed by interlacing the buildings in their design by waterways, lagoons, rows of richly-foliaged trees, and masses of shrubbery and flower-beds, a heavy border of canals and fenways encircling the whole. The Exposition is not to be a mammoth affair.

A uniform height of caves-line of 50ft. has been conformed to in the case of all the main buildings, upon which, with the red roofs and tinted walls, the unity of the whole will largely depend. Columns have been little employed, the character of the buildings depending more upon long lines of arcades and richly-detailed openings. "Staff" is the material being used. In composition the buildings have been grouped around a main court—"The Court of Fountains"—500ft. wide and over 1,000ft. long, and an almost equally large transverse court—"The Esplanade"—the plan of the grounds being like an inverted T, the main court for the perpendicular and the transverse court for the horizontal. At points of interest—the ends and intersections of the courts—between the lines of low roofs, the buildings are to be heavy in mass, while the lines of the composition will be supplemented by smaller buildings and features of the landscape gardening. The outside boundary of the grounds is rectangular, the corners being occupied, at the north-west, by a Midway Plaisance, at the north-east by a Stadium for sports, while along the east and west sides, respectively, will be open-air exhibits of agriculture and horticulture.

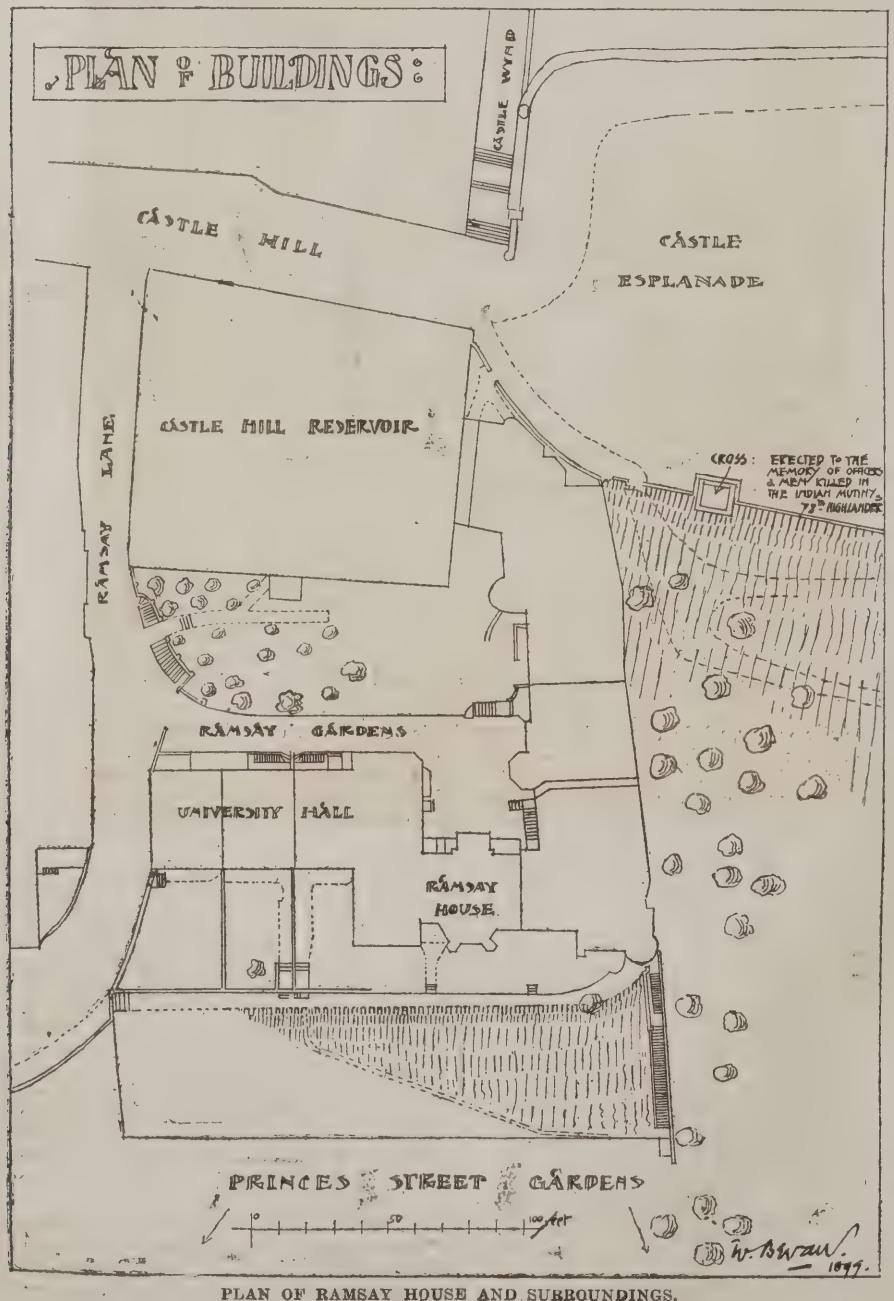
RAMSAY HOUSE, EDINBURGH, FROM PRINCES STREET GARDENS. DRAWN BY W. BEVAN.

Approaching the grounds from the city, one will pass through Delaware Park, with its lakes, arriving in a forecourt. To the left and right lie lagooned parks in which will be State buildings, colonial exhibits, music gardens, &c. From this point the transverse courts can be seen in profile, while the chief vista of the Exposition lies before—the view up the Court of Fountains, with the main buildings on either hand, the tall and monumental "Electric Tower" at the end. Balancing the composition, a massive bridge having four tall and heavy pylons, with richly decorated festoons between them and at each end, will lead across the lagoon from the forecourt to the esplanade. "The first impression" has been constantly thought of by Mr. Carrère, and he has forced his wish in this by having but two main entrances—one at either end.

At the right and left ends of the transverse courts stand the first two main buildings, each having a central part, square in plan, curved arcades on either side coming out to the front and ending in large wing structures, each group of one design. The United States Government Buildings, the group to the right, designed by James Knox Taylor, head of the Government architectural bureau at Washington, consists in the central part of a well-massed, high-domed structure, flanked by pavilions at the ends of a big columned portico, the base of the dome above the portico being banked in heavy decoration. The arcades and wings are simple, having plane surfaced piers and wall-spaces, all as shown in a centre plate in this issue. The buildings of Forestry and Mines, Horticulture and Graphic Arts, the group at the left of the transverse court, were assigned to Mr. R. S. Peabody, of Peabody and Stearns, Boston. They are much more elaborate in design, and suggest the naturalistic qualities of their exhibits. The central portion, balancing the dome of the Government Building, is a pagoda-like affair with tiers of straight and curvilinear roofs, corner towers and small Palladian arcades. As with the main building, all open places and much of the wall space are richly embossed in coloured decoration.

In line with the inside wings of the end buildings, and forming the intersections of the two main courts, stand, to right and left, the Ethnology Building and the Temple of Music, designed respectively by Mr. George Cary, of Buffalo, and Mr. August C. Esenwein, of Esenwein and Johnson, Buffalo. Both are massive domical buildings of considerable height, similar in mass and general design—symmetrical, with high columned base and protruding porches at the four sides, a drum of about half the area rising from the top, richly corniced and surmounted by a low dome. The Ethnology Building is circular in plan throughout, a Corinthian-columned arcade encircling the building between the projecting porches, arcade and porches being surmounted by statuary. The Temple of Music is octagonal in plan. The walls and domed vestibules have blind colonnades; the lines of the building are somewhat broken, and the whole is ornate in coloured and relief decoration.

The four main buildings flanking the Court of Fountains—Manufactures and Liberal Arts, Agriculture to the east, Machinery and Elec-



tricity to the west—have been made, roughly speaking, the same in mass and effect, though of very different designs. In the centre of the façades are entrances reaching high above the roof-line and encased within the heaviest architectural features of the buildings. With the exception of the Agricultural Building all have smaller tower constructions at the corners and between low, long arcades, for the most part simple. On each side the two buildings are designed by the same architect—the Manufactures and Liberal Arts, and Agricultural Buildings by George F. Shepley, of Shepley, Rutan and Coolidge, Boston; Machinery and Electricity Buildings by Edward P. Green, of Green and Wicks, Buffalo. The placing of the individual buildings accords more with the arrangement at Chicago than with that of the late Paris Exposition. Between the first two buildings on the main court and the building of the transverse court there will be two fountained courts, and a poplar-lined avenue will run between these first two buildings and the buildings of Agriculture and Electricity, the other sides of which will be the outlining canal and trees. On the minor courts—to the west, and to the east—and on the dividing avenue will be the main entrances of the four buildings. The Manufactures and Liberal Arts Building is the heaviest of all in design. The arcades are simple, single columns with small capitals supporting unmoulded arches. The wall space above is the least decorated of any, and there are but small brackets supporting the deep eaves. Corner towers are simple in treatment. The main entrance is ponderous in base, having a high-arched portico with columns and pediment of Classic lines. Corner piers, the height of the columns of the portico, are capped with richly sculptured lanterns, while from the middle, rising higher than all, is a crowned and ribbed dome. The Agricultural Building is the simplest of all in design. It has no corner constructions and with the exception of four entrances its main lines are unbroken. In outline the entrance consists of a wall-surface bounded by straight sides and a peaked and gabled roof penetrated by one high-arched opening. All the decorated parts are planned with the idea of the supplementation of colour, upon which will depend the interpretation of the form in this as in most of the detailed work of the Exposition.

The Machinery and Electricity buildings are at the west of the Court of Fountains. The main entrance of the Machinery Building is a big square pile surmounted by a low attic storey with open loggias and a low-peaked roof. In front rise two plain-shafted towers, which, from the height of the level of the top of the basal construction, continue in storied towers, capped by low steeples. Between the shafts of the towers, and protruding slightly, two single and two double columns form an entrance portico. The treatment of the lateral arcades is elaborate only in colour and grille work. Low corner towers surmount ornate entrances, having loggias under the eaves. The entrance on the main court and the one at the other end of the building are backed by domes, white drummed and finished with Spanish tiles, these forming a very important feature of the composition. The Electricity Building is Spanish in style. The arcades are similar to the other buildings, but having a colonnade supporting vine-racks. There are corner domed towers, and two high towers flank the entrance.

The Electrical Tower, designed by John G. Howard, of New York, is the most important building of the Exposition. Standing at the head of the Court of Fountains, rising from its water-basin three times higher than its surrounding buildings, and being the one purely monumental building in the grounds, the Electric Tower is the architectural climax of the Exposition. The tower is 350ft. high, having a rich shaft surmounted by three columned stories, rich in sculptural decoration. Colonnades come forward from the base, curving towards the south or main court, ending in small pavilions, elaborate with niches and statues. Water will flow from a cavernous niche at the base of the tower, descending over a series of steps and architectural interruptions, gushing from vases and motives in its descent to the expansive basin below, whence it seeks its way under the foreground to furnish the gorgeous display in the Court of Fountains.

Surrounding the Plaza behind the Electrical Tower are two large flanking buildings to be used for restaurants, a Propylæa, suggesting strongly the entrance structures at the Paris Exposition, and a Stadium for sports. All these are by Walter Cook, of Babb, Cook and Willard, New York. The entrance to the Midway (at the west side) and its balancing building, the entrance to the Stadium (at the east), consist in design of a long, low, hip-roofed building, pierced by arcades of nine arches, over which are windows on the one, and an open loggia on the other, this motive being flanked by telescoped towers at each end. The Propylæa, forming the north side of this supplementary court, screens the railroad-station beyond. It consists of a curved colonnade, above which is an arbour running the entire length of the colonnade and terminated at each end by a monumental arch.

Outside the Exposition grounds to the south, in the Park just before the causeway is crossed to the forecourt, a Greek temple composition is being erected at a cost of $350,000, in permanent material, to serve as the Fine-Arts Building. It has been designed by Edward P. Green. The ultimate object of the building is to furnish a home for Buffalo's Academy of Fine-Arts.

PLAN OF RAMSAY HOUSE AND SURROUNDINGS.

Nineteenth-Century Architecture.

CHIEF BUILDINGS ERECTED IN LONDON.

THE following is a list of the chief architectural works erected in London during the nineteenth century:—

Work.	When completed.	Architect.
Royal Mint	1811	Johnson and Sir Robert Smirke
Regent Street Buildings	1815	John Nash
Custom House	1817	David Laing and Sir Robert Smirke
Waterloo Bridge.. ..	1817	John Rennie
St. Marylebone Church...	1819	Thomas Hardwick
Southwark Bridge ..	1819	John Rennie
Bank of England ..	1821	Sir John Soane
Haymarket Theatre ..	1821	John Nash
St. Pancras Church ..	1822	H. W. Inwood
St. Luke's Church, Chelsea	1824	James Savage
Colosseum, Regent's Park	1827	Decimus Burton
Screen, Hyde Park Corner	1828	Ditto
University College, Gower Street	1828	William Wilkins
United Service Club, Pall Mall	1828	Decimus Burton
King's College	1829	Sir Robert Smirke
General Post Office ..	1829	Ditto
Sun Fire Office, Threadneedle Street	—	Prof. C. R. Cockerell (1788-1863)
Athenæum Club, Pall Mall	1830	Decimus Burton
Marble Arch	1830 & 1851*	John Nash

* First erected as a gateway to Buckingham Palace, and afterwards removed to its present position at Cumberland Gate, Hyde Park.

Nineteenth-Century Architecture—(*continued*).

Work.	When completed.	Architect.
London Bridge	1831	John Rennie
Travellers' Club House, Pall Mall	1832	Sir Charles Barry
City of London Schools, Embankment	1835	Davis and Emmanuel
Buckingham Palace ..	1835	John Nash
College of Surgeons, Lincoln's Inn Fields	1836	Sir Charles Barry
National Gallery ..	1838	William Wilkins
Reform Club, Pall Mall..	1841	Sir Charles Barry
Pentonville Prison ..	1842	
Royal Exchange	1844	Sir William Tite
Treasury, Whitehall ..	1847	Sir Charles Barry
Bridgewater House ..	1848	Ditto
St. George's Cathedral, Southwark	1848	Welby Pugin
Freemasons' Tavern, Great Queen Street	—	F. P. Cockerell
Record Office, Chancery Lane	1851	Sir James Pennethorne
Geological Museum, Jermyn Street	1852	Ditto
British Museum	1852	Sir Robert Smirke
Somerset House, Western Façade	1853	Sir James Pennethorne
Crystal Palace	1854	Sir Joseph Paxton
Holloway Prison.. ..	1855	Bunning
Carlton Club, Pall Mall..	1855	Sydney Smirke
South Kensington Museum	1857	Captain Fowke
Houses of Parliament ..	1857	Sir Charles Barry and Welby Pugin
Covent Garden Theatre..	1858	E. M. Barry
Foreign Office	—	Sir Gilbert Scott (1810-1877)
Westminster Bridge .	1862	Thomas Page
St. Alban's, Holborn ..	1862	William Butterfield
Charing Cross Station ..	1864	E. M. Barry
St. Mary's, Stoke Newington	—	Sir Gilbert Scott
St. Mary Abbots, Kensington	—	Ditto
St. Pancras Station ..	1868	Ditto
Meat and Poultry Market, Smithfield	1868	Sir Horace Jones
Blackfriars Bridge ..	1869	William Cubitt
All Saints', Margaret Street	—	William Butterfield
London University, Burlington Gardens	1869	Sir James Pennethorne
St. Thomas's Hospital ..	1871	Charles Currey
Albert Hall	1871	General Scott (assisted)
Burlington House (courtyard and Piccadilly facade)	1872	Barry and Banks
Albert Memorial.. ..	1872	Sir Gilbert Scott
St. Mary Magdalene, Paddington	—	G. E. Street
Brompton Oratory ..	1875	H. Gribble

All the large London hotels—such as the Grosvenor, Cecil, Metropole, Victoria, Grand, Great Central and Russell—and practically all the present London theatres—such as the Lyceum, Gaiety, Lyric, Daly's, Wyndham's, the Empire, and the Alhambra—have been erected since about the middle of the past century. In fact, the foregoing list gives almost all the most important buildings in the London of to-day, that is, in addition to the well-known buildings erected in past centuries, from the Tower onwards.

Law Cases.

Planing Machines: Workman's Unsuccessful Claim.—In the Scottish Court of Session, the Lord Justice-Clerk and jury recently heard evidence in an action by Robert Ronald, of Aberdeen, against Alexander Hall, house carpenter, also of Aberdeen. Plaintiff asked payment of £500, or otherwise £202 16s. as damages. He was in defendant's employment for nearly six years. On July 3rd last he was working at a surface-planing machine driven by a gas engine, when his right hand was rawed in and three fingers taken off. He averred that the accident was due to the fact that defendant had directed that the machine should be used as a moulding machine, a use for which it was not originally constructed. Plaintiff was a granite polisher by trade, and was not aware at the time of the accident of the proper construction of a moulding machine, nor of the risk he ran. Defendant denied fault, and pleaded contributory negligence on plaintiff's part. The evidence and speeches occupied the whole of the day till well on in the evening, but the jury were only about two minutes out when they returned with a unanimous verdict for the defendant.

Changing the Name of a Street.—Mr. W. J. Collins, of Fortis Green, answered an adjourned summons at Highgate Police Court last week for removing a street name-plate. Mr. Collins, it was stated, had laid out an estate at Muswell Hill, and called one street "Midhurst Avenue." The Hornsey District Council passed the plans with that name on, but received a complaint from a Mr. Arnold, of "Midhurst," close by, who objected to the name because he had a fine private avenue of trees leading up to his house from the entrance gates. The Council then gave the street the name of "Collingwood Avenue," the inclusion of "Collin" in the name being intended as a compliment to Mr. Collins. When the corner house was built the Council put up a name-plate, but it disappeared. Another was put up, and Mr. Collins ordered it to be blacked out. He was too modest, he informed the Council, to embody his name in the street name, and suggested instead the name "Arnold Avenue." The proceedings were under the Towns Improvements Act, under which the Council is the only authority competent to name a street. The defence was that the Council "adopted" the name in a sealed agreement with Mr. Collins with reference to the sewers, and it was not within the jurisdiction of the Council to change a name. The Bench (five magistrates) convicted the defendant, and fined him 1s. and 7s. 6d. costs.

GLIMPSE OF RAMSAY HOUSE FROM RAMSAY GARDENS. DRAWN BY W. BEVAN.

The New Victoria Central Hospital at Liscard has been opened. It was erected as a memorial of Her Majesty's Diamond Jubilee. The building cost £12,000, and the furnishing soot another £4,000.

Bricks and Mortar.

APHORISM FOR THE WEEK.

All artistic production involves a large element of lucky accident; of which the true artist alone knows how to avail himself.—COVENTRY PATMORE.

Our Plates. THE three houses in Austin Street, Hunstanton, St. Edmunds, are built of local brown stone covered with rough-cast in the gables, green slates being used on the roof. They were planned with a view to avoiding the dark and generally unsatisfactory "back additions" so usual in houses of this class. The work was carried out by Mr. John Nelson, of Hunstanton, from the design and under the superintendence of Mr. Herbert G. Ibberson, F.R.I.B.A., of 28 Martin's Lane, E.C., and Hunstanton. A drawing of these houses was exhibited in the Royal Academy of 1899. The coachman's cottage and stables at Hunstanton, St. Edmunds, also the work of Mr. Ibberson, contains living room, parlour, kitchen, and three bedrooms, and is built of local brown stone, with "half-timber" in the gables; it has a porch of ship oak from a wreck on the coast. Red tiles cover the roofs. The work was carried out by the late W. Southgate, of Hunstanton.—Particulars of the Pan-American Exhibition at Buffalo, New York, will be found on page 433 of this issue.

Tower of London: More Official Negligence. SINCE the demolition of the old Armoury House at the Tower there have been lying in the crypt underneath the chapel of the White Tower several sets of stained-glass windows. Not only are they valuable in themselves, but they are of deep interest to antiquarians and artists. "As far as we can judge," says the "City Press," "the windows were placed by Edward III. in that ancient chapel. When that edifice was removed, they were cut and remodelled in order that they might be placed in the Armoury House. Afterwards they found their way to the crypt. Some of the windows bear shields on which are different heraldic designs of ancient invention, and we advise those who are interested in heraldry to take an early opportunity of inspecting them. The niggardly policy of the War Office with regard to the Tower is well known, but that in no way absolves the authorities for the neglect shown in the present case. If nothing is done the windows will certainly remain where they are, for the Tower authorities will not move in the matter."

St. Clement Danes: the Origin of its Name. MR. AUSTIN BRERETON asks in his article on the "Strand Churches" why the dedication to St. Clement should arise from the fact that "Harold and other Danish Kings" are buried in that church. A correspondent of the "Morning Post" writes to point out that there are two possible explanations of this dedication. (1) That, like the famous church at Hastings, St. Clement Danes was dedicated during the Pontificate of Pope Clement II. (Suidger, Bishop of Bamberg, a Saxon, A.D. 1046-1047), and, in compliment to him, was named after his patron Pope, St. Clement I. (A.D. 93-101), known as Clemens Romanus, to whom the famous Basilica of San Clemente, near the Colosseum at Rome, is dedicated. (2) Because, as is represented in the frescoes of the ninth century on the walls of St. Clemente, Clement I. was martyred at Kertch in the Crimœa, a country which, in the very loose geographical terminology of western martyrologies, may have been included in the term "Dacia," a country which at one time certainly extended as far as the Dniester. The confusion in the chroniclers between "Daci" and "Dani" (Danes) is well known. A dedication to St. Clement Dacorum (of the Crimœa) would not seem misplaced to anyone who was acquainted with the Roman San Clemente, which, before its destruction in 1084 by the Norman Robert Guiscard, must have been one of the most famous churches in Rome, and remarkable especially for its frescoes with the history of its patron.

Seven Notable Bridges. *London Bridge* is constructed of granite, and is considered to be one of the finest specimens of bridge architecture. The present structure was commenced in 1824, and completed in seven years, at a cost of £1,458,311. *The Bridge of Sighs*, at Venice, over which condemned prisoners were transported from the Judgment Hall to the place of their execution, was built in the Armada year, 1588. *The Bridge of the Holy Trinity*, at Florence, consists of three beautiful elliptical arches of white marble, and stands unrivalled as a work of art. It is 322ft. long, and was completed in 1569. *The Niagara Suspension Bridge* was built in 1852–1855 at a cost of £80,000. It is 234ft. above high water, 820ft. long, and the strength is estimated at 1,200 tons. *The Rialto*, at Venice, is said to have been built from the designs of Michael Angelo. It consists of a single marble arch 98ft. long, and was completed about 1592. *Brooklyn Bridge* was commenced, under the direction of Mr. Roebling, the designer of the Niagara Suspension Bridge, in 1870, and completed in thirteen years. It is 5,989ft. long and 135ft. high. The cost of building was little less than £3,000,000. *The Lagong Bridge*, built over an arm of the China Sea, is five miles long, with 300 arches of stone, 70ft. high and 70ft. broad, each pillar supporting a marble lion 21ft. in length. The cost of the bridge is unknown.

An Old Chimney-piece. ONE of the most interesting discoveries, from an antiquarian point of view, which have been made at Hereford for about fifty years has been the unearthing of an ancient fireplace in St. Peter's Square, a few weeks ago. It appears that it is a fine old chimney-piece which bears evidence of being constructed about the fourteenth or fifteenth century. The width of the fireplace opening is 5½ft., the depth 2½ft., and the height 4½ft. It is executed in the local old red sandstone, the head being a fine block about 7½ft. long and 1½ft. deep. There is no shelf. On either side there are triple-clustered columns, with exquisitely moulded caps supporting overhanging chamfered "springer" stones. Bits of the, at one time elaborate, mould or cornice are in existence, and these appear to have returned round the projecting chimney breast until stopped by the wall on either side, which has long since disappeared. At the back of the fireplace was another having plain chamfered sides, with an opening of about the same width. It evidently formed part of the kitchen of the original house. It is a matter of congratulation that the whole was boxed in, or it would not have been in anything like the state of preservation it is. The only other similar fireplace in Hereford is to be seen in the north transept of the Cathedral, which was formerly used as a Consistory Court. At Chepstow, Kenilworth and Raglan there are also fireplaces of a like character. On the same spot where the chimney-piece was discovered are some very ancient arched cellars, but the existence of these has long been known.

Houses on "Made Ground" GOOD gravel has so largely come into request that many suburban lands with that valuable substratum are quarried to a considerable depth before being sold on building leases. But it is essential to restore a level surface, as even the most speculative builder would hesitate to run up "neat villa residences" in deep holes. The owner frequently gets over this difficulty by allowing urban refuse to be shot into the excavations; in many cases he even extracts a small sum for every load tilted on his ground. The surface being thus levelled, says the "Globe," a year or two is allowed for the soil to sink and become compact; occasionally grass is sown to give a natural appearance to the spot. All is now in readiness for the builder, who proceeds to lay the foundations for his "terraces," "avenues," and "gardens," which he subsequently advertises as "on gravel soil." So they are: but between their ground floors and the gravel lies a thick stratum of partially decomposed rubbish, teeming with malaria, and not for many years will the deposits cease to give off noxious gases. But the tenant coming from a different locality knows nothing of the "making" process to which the plot has been subjected. When, therefore, ill-health dogs his family, he puts it down to defective drainage or some other structural deficiency, and spends money freely on remedial measures without the least benefit. "All this misery might be prevented if it were legally prohibited to build human habitations on deposited refuse until a sufficiently long period for the soil to have acquired a wholesome character."

Stonehenge. ON the 1st of January some workmen going to work in the neighbourhood of Stonehenge discovered that two of the stones had fallen, one of them being broken in the fall. Many falls of stones at these famous ruins have been recorded during the past three centuries, and a comparison of the earliest drawing of the ruins still extant, dated 1575, with their present condition shows that many other stones have fallen from time to time, and several have been entirely carried away. Two of the most serious losses occurred in 1620 and 1797. In the former year the impost or upper stone of the central trilithon fell, and in the latter year a whole trilithon collapsed, the stones still lying to-day where they fell. We shall publish shortly an illustrated article on an old Welsh cromlech.

The Hôtel Lauzun, Paris. THE Hôtel Lauzun, which is one of the finest specimens of seventeenth-century architecture in Paris and was purchased by the city on the death of its late owner, Baron Pichon, is to be restored (not structurally) in order to give the exact aspect in every particular which it wore at the most brilliant epoch of its history, at the time when it was the home of the "Grande Mademoiselle," whose marriage is the subject of one of Madame de Sévigné's best known and most delightful letters. The stately apartments of the mansion are to receive choice specimens of the furniture of this brilliant period. The capital feature of the Hôtel Lauzun consists in the excellent wood carvings and decorative panels with which it is adorned.

Reform of the Pacca Edict. IN our issue for November 29th, 1899, we published an article by Professor Alfredo Melani on the Pacca Edict (a law demanding that a duty of 20 per cent. shall be paid on all objects of art exported from the Papal States.) The Italian Government has now decided to reform this antiquated and illogical edict. The fundamental principles of the Bill which Signor Gallo, Minister of Public Instruction, is about to bring forward, are as follows:—(1) The State has the right of pre-emption over all artistic and archæological objects in the Italian kingdom, whether above ground or buried. Their owners must, before proceeding to sell such objects, notify the Ministry of Public Instruction, which must decide either to buy such objects within three months or relinquish all right over them. (2) Objects exported after the State has foregone its right of pre-emption must pay an export duty varying from 5 to 33 per cent. of the value. From the minimum duty of 5 per cent., 2 per cent. is added for every £200 of the price, the cheaper objects paying least and the dearer objects most duty. (3) The proceeds of the duty are to be used as a fund for purchasing articles of archæological or artistic value which the State may decide to retain in Italy. An important part of the Bill relates to excavations which bring to light valuable objects. "The right of the State," Signor Gallo remarks, "extends in particular degree to treasures hidden or unknown, since no one can claim to possess them or to have paid a price for them. Excavations carried out on private property, if not absolutely forbidden by the State, must at least be superintended by experts who are in a position to take exact note of the site and condition in which the objects are found, and to decide on their artistic or historical value. But this superintendence on the part of experts in the employ of the State is expensive, and for this reason the State has a right to participate in the fruits of excavations."

THE TREATMENT OF LONDON SEWAGE.*

BY PROFESSOR FRANK CLOWES, D.SC.LOND.

THE consideration of any sanitary measure which affects London is of supreme importance, since it is related to the welfare of a population exceeding 5,000,000, or at least one-eighth of the total population of the United Kingdom. Since almost the whole of the London sewage is discharged into the Thames, the disposal of London sewage affects the most busy waterway in the world, a waterway which leads up to the premier city, which carries the commerce of all nations, and which remains open and unfrozen all the year. The shipping tonnage passing over this river, which has long been steadily increasing year by year, has now reached (1899) to over 23,000,000.

Causes of Nuisance and Danger to Health.

Under ordinary conditions the to and fro tidal action in the lower river prevents the sewage which is discharged into it from being wholly carried out to sea at once. Hence, when some years since the raw sewage of London was regularly poured into the river in the neighbourhood of the city, the road detritus and putrescible fæcal matter which were delivered in the sewage settled on the river-bed and foreshores. The road detritus tended to permanently reduce the depth of the river; while the putrescible matter, arriving faster than it could be removed by the river or could be destroyed by inoffensive bacterial action, accumulated as a deposit on the foreshores and floated in masses of thick scum on the river. It there underwent foul putrefactive changes, rendering the river most offensive to those who navigated it or lived and worked near its banks, and almost intolerable in summer weather, even to those who crossed its bridges. That this result was inevitable will be understood when it is remembered that the sewage consists of the whole of the water-supply and rainfall over the metropolitan area which have been charged with varied refuse matters of our streets, our houses, and our manufactories.

Removal of Nuisance.

The nuisance was removed by taking the sewage fifteen miles below London. Since this was found insufficient the sewage was subsequently subjected to chemical treatment and sedimentation before it was allowed to flow into the river. The treatment ultimately adopted and still in vogue consists in straining or "screening" off the larger solid matters and then mixing the sewage with solutions of lime and sulphate of iron; the chemical precipitate thus produced is then allowed to settle, together with the finer particles in the sewage, by sending the sewage slowly through parallel channels on its way to the river. The screenings or "filth" are disposed of by being dug into the ground; the settled matter, or "sludge," is sent in tank-steamers to be discharged out at sea beyond the river's mouth; while the fairly clear "effluent" passes constantly into the river from the northern outfall (Beckton or Barking) and the southern outfall (Crossness) in two streams, which jointly deliver over 200,000,000 gallons every twenty-four hours into the river, and which probably constitute the most important tributaries of the lower Thames near London. Since these processes of chemical treatment and sedimentation have been adopted the foreshores of the river have become clean, the outrageous foulness of the stream has ceased, and those who live on and near the Thames unanimously express their approval of the improvement effected.

Risks of Foulness.

It must be remembered, however, that the effluent of the sewage, after it has been freed from visible foul matter, still contains in invisible solution a large amount of putrescible substance, which may, under suitable conditions, lead to serious foulness in the stream. The effluent at present discharged into the river is practically only clarified sewage. As long as putrefactive changes are delayed by low temperature of the river water, and an ample flush of upper-river water comes down to dilute this effluent and to carry it rapidly out to sea, no sensible foulness occurs in the main stream. But in summer time, when high temperature hastens putrefactive change and diminishes the amount of oxygen dissolved in the river water, and when the flush of water from the upper river is diminished by drought and by the abstraction of larger volumes of the water by the water companies, the condition of portions of the lower river frequently closely approaches that necessary to cause offence. There can be no doubt that as the volume of sewage effluent increases, and the abstraction of upper-river water for water-supply also increases with the increasing population, these portions of the lower river must pass more frequently into a condition bordering upon or actually causing foulness. It is, therefore, prudent to be prepared to adopt without delay a method of treatment of the London sewage which shall meet the requirements of an increasing population, and shall enable the more ample effluent to be discharged into the river in a state of greater purity than is at present secured.

Steps taken for Future Improvement.

As far back as 1893, the Main Drainage Committee of the County Council, on the advice of their chemist, Mr. Dibdin, started a large scale experiment on the bacterial purification of sewage, the purification being applied to the effluent from chemical treatment and sedimentation. This experimental treatment has been continued by the committee, on my own advice, and has been considerably extended in its scope. The committee also consented to the association of the eminent bacteriologist, Dr. Houston, with me in these experiments during the three years of their progress, and I wish to acknowledge the great advantage derived from this association and from the intelligent and hearty co-operation of the resident superintendents and chemists, Messrs. Beal, Bigg, Stokoe and Pike. The results which have been obtained have been published by the London County Council in the form of a series of reports which I have laid before them from time to time. The general conclusion to which they point is that the settled sewage may be purified to a far greater degree than it is by the present treatment by encouraging the spontaneous purifying action of the bacteria which are present in the sewage itself. The effluent thus produced, without the intervention of chemicals, remains free from foul putrefaction and is able to support the life of fish; in these and in all other respects it is greatly superior to the effluent which is at present discharged into the river. The minute vegetable organisms, known as bacteria, exist to the average number of 300,000 per drop of sewage. They only require to be placed under suitable conditions in order to effect the rapid and inoffensive resolution of the putrescible matters of the sewage into harmless and inoffensive products.

Bacterial Treatment and its Adoption.

Professor Frankland referred in a recent address to the classic researches of the Rivers Pollution Commission of 1868, who were soon led to recognise that the important factor in determining the efficiency of sewage disposal by broad irrigation is the passage of the sewage through the pores of the soil, or, in other words, filtration. He says:—

"The most striking feature about the results of their experiments is the extraordinarily rapid transformation of ammonia into nitrates, which occurs during this passage through a few feet of soil. This nitrification process was at the time supposed to be simply a case of direct chemical oxidation by atmospheric oxygen; indeed, it was not until seven years later (1877) that the astounding discovery was made by Schlössing and Muentz that this change is entirely dependent upon the vital energies of micro-organisms, and it was not until 1890 that the particular bacteria responsible for this important reaction were isolated and characterised. With these discoveries the whole process of sewage purification by contact with soil was shown to be of a bacteriological character. In consequence of this it was only natural that attempts should be made to partially regulate or domesticate the bacteria capable of carrying on such important work.

"The domestication of micro-organisms is of course no novelty; the fermentation industries which have been carried on from very ancient times are all examples of the domestication of microscopic living organisms by man. The yeasts carrying on the work of the brewer and the distiller, the bacteria engaged in the manufacture of vinegar, as well as the medley of organisms concerned in the production of cheese, are all domesticated in essentially the same sense as the horse which draws the waggon or the plough, the pig that fattens in the sty, the herds of sheep and cattle in the fields, or the miscellaneous population of the duck-pond and the poultry-yard. The taming and domesticating of the bacteria capable of purifying refuse organic products in reality unconsciously commenced in the establishment of sewage farms and in the construction of intermittent filters. The progress of the past few years consisted in training these bacterial servants to a higher degree of efficiency, and in improving the conditions under which they labour by providing them with more suitable food, assigning to them particular raw materials which they have a special capacity to deal with, and above all providing their workshops with the ventilation which is necessary for the proper discharge of their functions.

Professor Frankland, who has recently acted as an expert chemical and bacteriological adviser to Manchester on the question of sewage disposal, has arrived at results so similar to those which have been reached by the London County Council's experimental work, that I wish to draw attention to them in the present paper. He considers that the bacteriological is the most useful and economical method of treatment for purifying sewage, but that the system must be applied with proper consideration of the conditions of the district, and must be under a general intelligent supervision in order to secure and maintain its success.

He draws attention also to the fact that—"All the great developments in the purification of sewage—chemical precipitation, irrigation, intermittent filtration, and bacterial treatment (including septic solution)—are essentially British, although we are deeply indebted to America for the extraordinary diligence with which some of its men of science have conducted a truly monumental series of experiments demonstrating the great possibilities of intermittent filtration."

He urges, therefore, the desirability of this country adopting its own improved methods; and he goes on to speak of the advantage which would result from having in this country—

"An organisation which would carry out experimental investigation into sanitary subjects on the scale and with the thoroughness adopted by the Massachusetts Board of Health."

The London County Council has in recent years to a large extent met this requirement, as is shown in the present paper.

Professor Frankland then drew attention to the very different attitude which even a progressive community is apt to assume towards an improved scheme of sewage purification which does not appear at first sight to be of material advantage to it, as compared with its attitude towards public works which provide for the supply of water, gas, electricity, tramways, and other necessities which are seen at once to benefit the community and possibly to bring money returns into its exchequer. Public opinion is, however, undoubtedly becoming enlightened on these matters, and is prepared to consider good health as being worth providing for and even paying for.

In conclusion the lecturer gave the general conclusions derived from the experimental bacterial treatment of raw sewage at the outfalls of the London sewage into the Thames, which were published in the issue of THE BUILDERS' JOURNAL for March 21st, 1900.

A New Conservative Club at Brixham has been erected, at a cost of £1,500, from plans by Mr. E. Richards, of Torquay. The contractors were Messrs. Hazelwood, of Brixham.

* A paper read before the Society of Arts on December 12th, 1900. Professor Clowes is Chemical Adviser to the London County Council.

Engineering Notes.

The Proposed Electric Railway Under Hampstead Heath, with stations on the Heath and North End, is to be opposed by Hampstead residents.

Messrs. E. H. Shorland and Brother, of Manchester, have just supplied some of their patent Manchester grates to the Board schools at Workington.

Messrs. Hayward Brothers and Eckstein, Ltd., engineers and ironfounders, of Union Works, Union Street, Borough, London, S.E., have opened a branch office and showrooms at 63 Mosley Street, Manchester, for the convenience of their Lancashire, Cheshire and Midland customers.

A New Baronet.—Among those in the New Year Honours who receive baronetcies is Mr. John Aird, M.P., the well-known contractor for public works. At present the firm with which he is connected is engaged in the construction of large irrigation works in the valley of the Nile. He has also the distinction of having been selected as the first mayor of the new borough of Paddington.

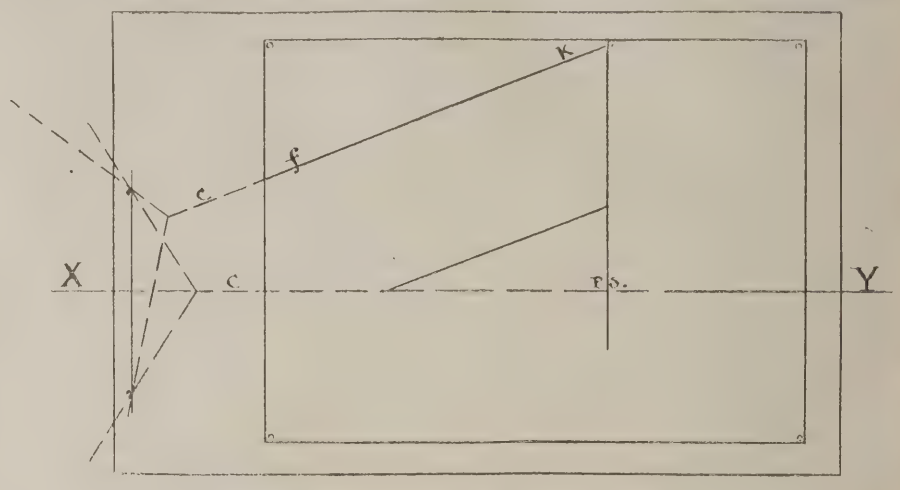
Underground Railways and Vibration.—The Board of Trade have appointed a committee, consisting of Lord Rayleigh (chairman), Sir John Wolfe-Barry, and Professor Ewing, to consider to what extent the working of the traffic on the Central London Railway produces vibration in the adjacent buildings, and what alterations in the conditions of such working or in structure can be devised to remedy the same.

The late Dr. W. Pole, F.R.S., who died recently at the age of eighty-six, combined two most opposite qualities—he was an eminent civil engineer and a musical theorist. One would hardly suppose one man capable of excelling in such very different branches of work; but many others have done the same. Lewis Carroll, for instance, was an abstruse mathematician and, at the same time, one of the most delightful writers of children's stories.

Guildford Town Bridge.—The old town bridge at Guildford, which was destroyed by the floods in February last year, is to be replaced by a steel structure. Since the bridge was wrecked the Corporation has been engaged in deciding who was responsible for its re-erection, and an arrangement has now been reached by which the Corporation of Guildford, the County Council of Surrey, and the Godalming Wey Navigation Commissioners will each contribute to the cost. The National Society for the Preservation of Ancient Buildings petitioned the Town Council to as far as possible preserve the character of the old bridge, and an influentially-signed petition was also presented to the Council in favour of a bridge of stone. As, however, a steel bridge can be erected in less time, and will also give more waterway and a better gradient, the Council decided in favour of steel.

Bill for Widening London Bridge.—Clause 8 of the London Bridge Widening Bill, to be introduced during the ensuing session of Parliament by the Corporation of the City, describes the proposed widening in the following terms: "1. A widening of London Bridge on each side thereof, such widening to commence in Adelaide Place at or near to the top of the stairs leading from Adelaide Place to the River Thames at the northern end of London Bridge, and to terminate at or near to the top of the stairs leading from the northern end of Borough High Street to the River Thames at the southern end of London Bridge. 2. A widening to an extent not exceeding 20in. or thereabouts on each side thereof of the bridge carrying King William Street over Upper and Lower Thames Streets." Powers are sought in connection with the widening to alter and divert the foot and carriage ways of the bridge, and to stop, temporarily or permanently, any part of the stairs leading from the Thames to London Bridge. Five years is the period taken for the completion of the work, and power is sought to borrow money for the widening on the credit of the Bridge House Estates to the amount of £100,000, and "such further sums as may be necessary."

Correspondence.



Use of Centrolinead for Perspectives.

To the Editor of THE BUILDERS' JOURNAL.

HERSHAM.

SIR,—May I be allowed to reply to Mr. Sampson (see page 405 of issue for December 26th last)? He seems to think none of your readers could set a centrolinead in less than a week. I do not think Mr. Adams' reply tends to simplify the question. The method shown by the accompanying illustration has the merit of being introduced by Mr. R. Phené Spiers, F.S.A., Master of the Architectural School of the Royal Academy. It has also the merit of being very simple. XY represents horizontal line, P S point of sight, C C working edges of centrolinead. What is not shown in the diagram will be understood by setting out the plan and determining the station point. All that is necessary in setting the centrolinead is to get used to the instrument, and to adjust it to coincide with XY and vanishing line F K, as shown.—Yours truly,

ROBERT RAMM.

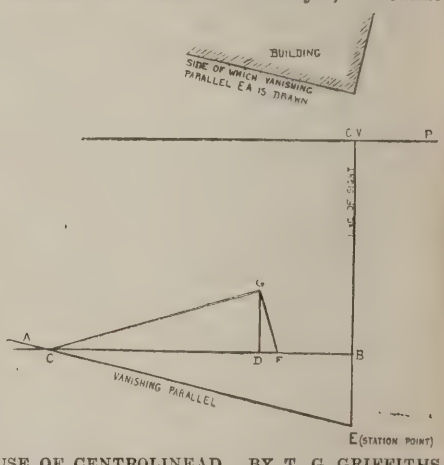
USE OF CENTROLINEAD. BY ROBERT RAMM.

To the Editor of THE BUILDERS' JOURNAL.

LONGTON, STAFFS.

SIR,—With regard to the correspondence about setting the centrolinead for perspectives, I find the following *graphic* method very useful; it is very simple, requires but a few straight lines, and can be carried out in a few moments. Of course, as in all graphic diagrams, accuracy of drawing is essential. In practice the drawing is made on the sheet of paper on which is the plan of the building to be drawn and the station point (E). For diagram see accompanying illustration. From E draw vanishing parallel E A of indefinite length. On E (CV) take *any* suitable fractional part E B (say $\frac{1}{4}$). From B draw B C parallel to P P (plan of picture plane), cutting E A in C. (Thus, E C : E A :: E B : E, CV. Here E A represents the whole length of the vanishing parallel, i.e., from E to where it cuts P P.) On B C mark the point D, making B D equal to fractional part (same fraction as before) of the distance the studs are actually set from CV on the paper to receive the perspective drawing. (Note: this distance may be anything convenient.) At D erect perpendicular D G equal to fractional distance of studs above horizontal line on perspective drawing. Join C G. From G draw G F at right angles to C G, cutting C B in F. Then, when the blade of the instrument is placed along C B (produced if necessary) the top arm is to be set along the line F G. The angle for the lower arm is of course the same, the studs being at equal distances from horizontal line, i.e., equal to L G F C. The principle is that when the blade is placed on H L (horizontal line), which corresponds on the reduced scale with C B, the required angle G F C is formed by C B and a line G F drawn from G (corresponding to stud) at a tangent to a circle, of which C (corresponding to vanishing point of line) is the centre. The fractional part of E, CV is taken so as to reduce the scale in order to bring C "within reach," and is merely determined by the size of the paper at disposal. I have never seen the above method described in books, and do not know if it is in use by practical draughtsmen; so far as I am concerned it is original; it is certainly simple and quick, which, to an architect's assistant like myself, is no small recommendation.—Yours truly,

T. H. GRIFFITHS.



Road Making and Maintenance.

To the Editor of THE BUILDERS' JOURNAL.

CUPAR (FIFE).

SIR,—I am much gratified to see your review of my book on road-making in your issue for December 26th. Generally speaking, the criticism is very favourable and sensible. I should, however, like to point out that I have not seen Mr. Maxwell's book yet, so cannot discuss the points you raise. The "Historical Sketch" was written in the latter part of 1896. The chapter on the laying-out of roads (including the drawings) was principally taken from a paper on this subject written by me about twenty years ago, when engaged on railway construction. I hope these explanations will be satisfactory.—Yours truly,

THOMAS AITKEN.

USE OF CENTROLINEAD. BY T. G. GRIFFITHS.

Masters and Men.

Strike of Quarrymen.—Two thousand quarrymen employed by the Buxton Lime Firms, Limited, are out on strike because they now refuse to sign the customary New Year agreement binding them to work for the company for the ensuing twelvemonths. The men are members of the Gas Workers and General Labourers' Union, to which society the dispute was referred. The decision was that the men can work but must sign no contract. The Lime Firms Company, however, will only allow them to work upon their signing the agreement. This is the first strike in the limestone trade in North Derbyshire since 1873.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Stresses in Domes.

LONDON.—E. J. writes: "To ascertain the position of the line of pressure at the abutment of a stone dome of uniform thickness, am I right in treating a sector, acting at its centre of gravity, in the same way as the line of pressure is found in arches, and if the line of pressure thus found falls within the *inner* line of shell, is this still more stable than when it falls within the area of base of shell? Is there any practical work on the construction of stone domes?"

The thrust of a dome, built on the principle of the arch, can be arrived at graphically by the method used for an ordinary arch. A wedge-shaped slice is supposed to be cut out of the dome from base to crown, and balanced or counteracted by an equal slice cut out of the opposite side. Their mutual pressures at the apex act horizontally, and tend to produce tension. In working out the stress diagrams the loads are treated as acting on their centres of gravity, as in an ordinary arch; but as the weight in a dome diminishes towards the crown it is evident that the thrust at any given point is less than that exerted at the corresponding point in an ordinary arch of equal span and thickness. The condition of stability is that the line of pressures or curve of equilibrium shall be well within the thickness of the shell; some authorities say it should occupy the middle-third, while others extend this limit to the middle-half. As the line of pressure leaves this margin of safety, and approaches the edges of the arch ring—outside or inside—tension is produced, and increases until the curve passes beyond the material altogether, and the vault gives way. If a dome be approximately designed and the curve of pressures is found by trial to pass outside the extrados, the dome would be depressed; but if the curve passes below the soffit the dome would bulge or burst. Bearing in mind that the curve of equilibrium is an imaginary line representing the centre of pressure throughout the section of the dome and also that if this line is kept within the middle-third of the thickness but little or no tension is produced, then it is clear that the substance of the arch ring might be removed, excepting that portion immediately around the line, and the arch would remain stable, if the material were strong enough to resist crushing. This could not be said of an arch or vault when the line of pressure passes outside the shell, either above or below; therefore, a dome more nearly approaches stability when the curve of pressure is entirely within the shell. Generally, any inherent weakness in he section of a dome is easily counteracted by the application of either extra thickness or a tie; and, in practice, domes of uniform thickness are rarely seen, being reserved for analytical enquiry only. The same may be said of domes built of stone voussoirs; homogenity and strength can be so much more thoroughly and readily attained by the use of concrete. At the moment we can think of no technical work on the construction of domes built entirely of stone voussoirs—domes of any importance where elasticity would be a factor.

Regulations with Regard to Saw-guards.

LIVERPOOL.—T. S. writes: "If a saw-guard is fixed on a bench over a circular saw driven by a gas-engine and the man who works the saw takes the guard off and works without it, and on the wall is the notice 'Fix Guard,' can the employer be fined?"

If the workman removed the saw-guard when he need not have done so, and was injured in consequence, the owner would not be liable, unless it could be shown that the accident was caused through some defect which the employer ought to have remedied.

G. H. B.

Liability of Local Authority for Accidents Caused by Projections on Road.

HIGH WYCOMBE. — SUBSCRIBER writes: "Since the reply to my query was published on page 374 of your issue for December 12th, with reference to the liability of local authorities for accidents caused by projections on roads, I find that there is the case of *Oliver* v. *Horsham Local Board*, which overrules the case quoted—*Kent* v. *Worthing Local Board*. In order that no misunderstanding may arise, your expert may wish to refer to this case, and possibly revise the answer."

In the case of *Oliver* v. *Horsham Local Board* the Queen's Bench Divisional Court decided in favour of the plaintiff, but the decision was reversed on appeal. [C.A. [1894] 1 Q.B. 332.] This case certainly overrules *Kent* v. *Worthing Local Board*, and it now appears that no damages could be recovered, though the parties in default may be subject to penalties.

G. H. B.

House Decoration.

WALSALL.—X.L. writes: "Which is the best book on painting and French polishing; also, what is the best green stain for picture mouldings and furniture?"

"House Decoration" and "Wood Finishing" are practical manuals, published by Cassell and Co. at 1s., which would be useful; "Practical House Decoration" (5s.) and "House Painting, Graining, Marbling and Sign Writing" (6s.) are published by Crosby Lockwood and Son; and there is a work, "Modern House Painting," by Rossiter and Wright, published at 21s.; "Polishes and Stains for Wood" is published at 1s. by Upcott Gill. A good green stain may be made by dissolving 4ozs. verdigris and ½oz. indigo in 3 pints of good vinegar. The indigo may be proportioned according to the shade required, and, in order to get a good effect, the stain should be applied hot, so as to get it into the pores of the wood. Aniline dyes make good stains, and almost any shade can be obtained by admixture of the various colours. Another green stain may be obtained by first treating the wood with a concoction of turmeric, followed by an application of Prussian blue.

H. E.

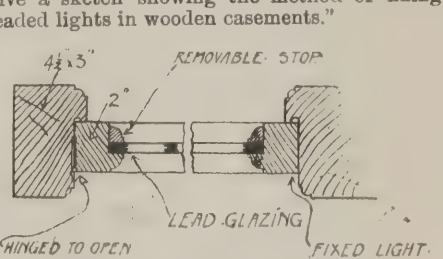
How to Make Models of Buildings.

LONDON, W.C.—R. J. B. writes: "I should be glad to know the best method of making a small model of a building fit for exhibition, and the materials to be used."

Models can be made in cardboard, wood or plaster, the simplest material being cardboard. The elevations should be drawn on the cardboard and then inked in, such portions as windows, doorways, &c., which are drawn on another thickness, being cut out. The whole is then carefully coloured and cut up, care being taken to bevel the corners, so as not to show a square joint. The pieces can then be stuck up with glue on a rough wood frame, or small pieces of wood or cardboard can be put crossways inside as struts and at angles for strengthening. The roof may be made of plain cardboard and paper ruled to imitate slates or tiles (as the case may be) and pasted on afterwards. Small pieces, such as chimneys, window sills, down-pipes, &c., should be cut out of solid wood, and can be painted in body colour. Green cloth and dyed sponge are good substitutes for grass and trees, whilst portions required to be gravelled should have a coat of strong gum and be dusted over with fine sand whilst wet. Wooden and plaster models are more difficult, as they not only require practice in the making but need a number of tools to finish them off well.

J. B. T.

Thickness of Walls required under By-laws.



LONDON.—L. V. H. writes: "Referring to the question and answer on page 374 of your issue for December 12th, it is quite obvious that 'St. Albans' could not build his wall 9in. thick, because the storey is over 10ft. high; but if it were not so and the whole height of wall were less than 30ft. he ought to be allowed to build it 9in. thick. A local council lately rejected some plans of mine because a one-storey warehouse was shown with 9in. walls, less than 15ft. high and the storey less than 10ft. high. Do you consider they were right (they contended that as it was the bottom storey it must be 13½ in. thick)? The London Building Act, part II., paragraph 11, contains precisely the same wording as (*j*) of Model By-laws, and in London I have built such walls with the approval of the district surveyor."

Under the Model By-Laws, 20 (*a*) provides that where the warehouse wall (party or external) does not exceed 25ft. high, it shall be 13½in. thick at its base. Under (*j*) it is provided that in walls not exceeding 30ft. high the walls of the topmost storey may be 9in. thick, provided that the height of that storey does not exceed 10ft. In the case of the one-storey building mentioned, I see no reason why it should not have been regarded as a topmost storey, and enclosed with 9-in. walls with a 4½-in. set-off to 13½in. at the base. I am of opinion, therefore, that the local authority were wrong in requiring 13½-in. walls. I should place the same interpretation upon Part II. (1) and (11) of the First Schedule of the London Building Act, 1894.

Fixing Leaded Lights in Wooden Casements.

HUDDERSFIELD.—STUDENT writes: "Kindly give a sketch showing the method of fixing leaded lights in wooden casements."

SECTION OF WOODEN CASEMENT.

The accompanying sketch will doubtless meet our correspondent's requirements.

R.W.C.

Preventing Draughts in Smoke-Room.

PRESTON.—NOUVEAU writes: "I send enclosed plan and section (not reproduced) of a smoke-room, and should be glad to know how to prevent the cold draughts which circulate near the windows. Persons sitting under the windows constantly complain of the downward currents of cold air, which I presume are due to the condensation of the warm air on the windows. Would double-glazing the windows prevent these draughts, supposing also the hot-water pipes were continued up to the underside of window board to warm the intervening air-space? Fresh air is only admitted into the room by the opening of the top fanlights, which, I think, is a bad arrangement. Would it not be better to provide one or two air-inlets in the external wall about 6ft. from the floor-level, and fix, say, Boyle's air-inlet brackets to them? The room is heated by an open fire-grate and two rows of heating pipes of 3in. diameter: this is probably insufficient to warm the cubic air-space, but I note the following remarks in Boyle's catalogue:—'Where open fires are used, they should have a separate air-supply led directly to them from the outside through a 3 or 4 in. pipe, to prevent them drawing the hot vitiated air from above down into the breathing zone, creating draughts and unduly affecting the ventilating arrangements.' I cannot see how this air-supply could be arranged in my case, as the open firegrate projects beyond the jamb of chimney; but do you consider this air-supply absolutely necessary?"

The provision of proper fresh-air inlets would go far to obviate the defects complained of. A pipe should be carried, as suggested in Boyle's catalogue, from external air, under floor, to a grating either in the hearth or in the fender curb, so as to supply air to the fireplace. Another similar pipe might well be carried to the back of the fireplace, discharging warmer air into the room about 10ft. above floor level—though this involves the removal of the grate and the construction of a separate flue. Other similar inlets could be provided into casings covering short lengths of the heating pipes, these casings also being carried up about 8ft. or 10ft. before discharging heated air into the

room. There is no necessity to fix the fanlight, which it may be very useful to be able to open in summer, but both it and the fixed sashes might be glazed with plate glass if preferred, as a cheaper alternative to introducing the inner frames—which, however, is generally satisfactory. G.A.T.M.

M.S.A. Examinations.

MANCHESTER.—P. C. writes: "Kindly inform me where to obtain particulars of the above examinations."

Apply to the Secretary of the Society of Architects, St. James's Hall, Piccadilly, W.

Permanent White for Exterior Work.

MANCHESTER.—E. W. writes: "Can you give me any assistance by advice in procuring a reliable permanent white exterior result upon brickwork? I have tried whitewash, which requires re-doing every year, and so becomes costly. I have also tried Portland cement finished with a final coat of Keen's, and I am told this will not stand the weather; in some cases I find it has, and some not after some four years. I do not want rough-cast as it is not white, and then in smoky districts I find the surface holds so much dirt that in a very short time it is almost black. If it is not possible to get white, what would be the nearest to it, leaving a smooth surface? I have many times asked various plasterers these same questions, but they appear to be either very uncertain or contradictory."

Obviously it is impossible to obtain a permanent white plastic surface for exterior work. Even stone, terra-cotta, brick, marble and other constructional materials sooner or later show the grimy effects of smoke and atmospheric influences. White-glazed bricks and tiles afford the most permanent white surface, but are not suitable for some positions and purposes. Keen's cement, being formed from a gypsum basis, will not resist damp or atmospheric influences; the refore it is unsuitable for exterior work. Painting with a suitable oil paint will indurate the surface and retain the colour longer than whitewash. Painting, unlike whitewash, has the disadvantage of being costly, and requires renewing periodically. A fairly good white or cream-coloured surface can be obtained by using Portland cement in combination with white aggregates, such as silver sand, white spar, white marble sand, and Bath stone dust. Portland cement and sharp sand should be used for the floating coat, taking care that the joints of the brickwork are freed from lime mortar, and the whole surface thoroughly cleaned and wetted. Cement adheres to and eventually becomes much harder when laid on a damp surface than if laid on a dry or porous one. The fining coat is composed of two parts of Portland cement and three parts of white aggregate. An extra white surface can be obtained by mixing the cement with a tenth part of well-sifted powdered whiting. The cement and whiting should be well mixed together in a dry state, and then the silver sand or other white aggregate added and thoroughly mixed before the mass is gauged. The fining coat should be finished with the trowel to get a close, smooth, and impervious surface, to allow the rain to run off freely, and to resist the effects of rain and snow. A smooth surface helps the rain and wind to wash and blow off surface dust. W. MILLAR.

Colouring Plans on Parchment.

BATH.—V. S. writes: "Which is the best way to colour plans on parchment deeds, &c., so that the colour looks even, and does not go through the skin? Should it be put on in one operation? Are there any special colours for this work?"

The parchment should be pounced and cleaned off in the usual manner, and the colours applied with as little water as possible, though there must be sufficient to enable a good wash to be laid on evenly. On deeds, as with every other kind of work, colour should be laid on cleanly and decisively: going over the work twice will most probably produce "woolliness" and give the wash an uneven spotty appearance. Any good water-colours can be used for colouring plans on parchment.

Professional Practice.

London.—The new Camden Theatre, opened recently, is situated exactly opposite to the Cobden Statue, with a frontage of 72ft. to High Street and 160ft. to Crowndale Road. From pavement to roof the height is 60ft., whilst above this is a copper-covered dome, reaching to an additional height of 36ft. A flambeau on the very top of this is lit up at night. The frontage to High Street, and 52ft. of that to Crowndale Road, is of stonework, the remainder being of red brick with cement dressings. Mr. W. G. R. Sprague is the architect. From the vestibule (36ft. long by 15ft. wide) is a flight of white marble steps leading to a crush-room. This is decorated with marble fittings, and extends to a length of 40ft., with a width of 19ft. Immediately above this are the saloon and bar, decorated with silk panels and painted work. The corridors connecting the different parts of the house are wide and roomy, so that the theatre could be emptied in a few minutes should occasion arise. The interior has a scheme of cream and gold colouring, together with the ruby plush upholstering. The pit is large, and a good view of the stage can be obtained from all parts. The house is on the two-tier cantilever principle, dress-circle and balcony being on the first tier and amphitheatre and gallery on the second. There are fifteen rows of seats in the gallery, six in the dress-circle, and seven in the balcony. A feature has been made of the smoking lounge on the circle level. From the pit level to the sun-burner in the centre of the roof the height is 48ft. The ceiling round this sun-burner is painted with allegorical figures. All the decorations and upholstery have been supplied by Messrs. Waring, of Oxford Street. The stage extends to a depth of 56ft., and is 80ft. in width. The proscenium opening is 35ft. by 28ft., whilst from floor to grid is 55ft. The dressing-rooms are fitted with every convenience, and are well ventilated and lighted. Gas and electric light are used. The holding capacity of the theatre is more than 3,000. The builder is Mr. Walter Wallis, who also built the Coronet, the Kennington, the Royal Duchess, and other well-known theatres.

Sudbury—A new infant school erected by the trustees of the North Street Church Schools, Sudbury, has been opened. A sum of over £1,000 has been expended on this erection. The Diocesan Surveyor, Mr. W. M. Fawcett, M.A., of Cambridge, prepared the plans for the new buildings, the contractors being Messrs. George Grimwood and Sons, Sudbury. The new schools are calculated to accommodate 270 scholars. The main infant schoolroom is about 50ft. by 20ft. by 13ft., while there is a large double class-room 20ft. by 40ft., divided by a sliding partition. In addition, there are two large class-rooms and a lobby. The whole of the walls have a dado, 4ft. high, with a chocolate-coloured border, of salt-glazed bricks. The floors are of tongued wood blocks laid in bitumen.

Tudhoe, Spennymoor.—A new home, the work of which has been in progress for two years, has been erected at a cost of £10,000. Tudhoe Home—the old home—was instituted over fifty years ago, with the object of housing, feeding, clothing, and imparting instruction to homeless and destitute little girls. The inmates having increased considerably, it was found absolutely necessary to erect a new home. The contractors were Messrs. Johnson and Hanby, of Stockton-on-Tees; and the architects Messrs. Dunn, Hansom and Fenwick, of Newcastle-on-Tyne. The new building, which has a frontage of 208ft. occupies a site immediately adjoining St. Charles's Church. The exterior is built of red pressed bricks, neatly cut, and weather jointed. The arches over the windows are of moulded Grosmore bricks. A low wall, surmounted with coping and massive iron-wrought pallisading, adorns the front or north-east portion of the building. There are two entrances, whilst a third one admits of access to and from the church. The broad and lofty corridor, facing the main entrances, runs the entire length of the building, and its walls, are inlaid with green tinted Opalite tiling. At the extreme end of the corridor are the lavatories, &c. Here white Opalite has been utilised. On the same floor is the class-room, 56ft. by 20ft. The staircase, winding from the ground floor to the summit of the building, is built wholly of polished pitch pine. The steps are of moulded cement, supported by symmetrical girders, the work being ornamented with a green shaded Opalite. On the second and third landings are the dormitories and lavatories, replete with the latest improvements, and in close proximity are large baths. On the western landing a range of dormitories, &c., have been fixed and arranged in precisely the same order. Ample arrangements have been made for cooking. Accommodation is found for 160 children.

Builders' Notes.

Messrs. Beynon Brothers, builders and contractors, of Tenby, have recently opened a new showroom in connection with their Warren Street premises, where a selection of fire-grates, and painters' and builders' requisites generally, can be inspected.

Councillor William Maben, of Manchester, died last week. Mr. Maben, who was born at Coatbridge, near Glasgow, and completed his 51st year in June last, went to Manchester 30 years ago. He was by trade a builder and contractor, but he relinquished that business some years ago, and latterly acted as a consulting engineer and specialist in the building trade.

Mr. Alexander Anderson, member of the firm of Messrs. G. Fordyce and Co., builders, Aberdeen, died last week at the age of 57. In 1864 he went to Aberdeen, and joined partnership with the late Mr. Fordyce and Mr. William Watt, the latter being now the sole surviving partner. He leaves eight of a family, his two eldest sons—Mr. John and Mr. George Anderson—being architects in London.

Building at Woking.—Messrs. Alexander H Turner and Company, auctioneers, inform us that they have postponed the sale of the freehold building estate at Horsell, Woking announced to take place at the Mart on the 16th inst. under this heading on p. 427 of our last week's issue. The sale will take place at an early date, however, and the area of the estate is 73½ acres, and not 72 as stated.

Local Authorities and Builders.—At Kirkham, recently, a building contractor named Thomas Royles was summoned for having acted as a councillor after having been disqualified by taking part in contracts entered into by the Kirkham Urban Council. The case for the prosecution was that the defendant fulfilled contracts in the name of one of his workmen. The case was eventually withdrawn on payment of the costs, but Royles was to resign his seat on the Council.

Messrs. E. and H. Lumley, land agents and auctioneers, of St. James's House, 22 St. James's Street, London, S.W., have registered as a private limited liability company, under the title of Lumleys, Limited, for their personal convenience in the management and administration of their greatly increased business. The constitution of the firm remains unchanged. Mr. Henry Lumley will be governing director, and will give the same personal attention to the business as heretofore.

British Fire Prevention Committee.—Pending the opening of its new testing station, the British Fire Prevention Committee will issue reports on tests undertaken in the past year with Mural and Decorations Company's floor, the "Cunnah-Wright" partition, the Williams' fire-blind, with two iron doors and two pairs of wood doors. Summaries regarding tests undertaken at the North Bank testing station are also in preparation. Regarding the committee's new testing station at Westbourne Park, a sub-committee of the executive will have charge of the arrangements, Mr. Ellis Marsland presiding.

THE BUILDING TRADES IN 1900.

ALTHOUGH generally the trade and finance of this country have increased during last year, yet in the building trade the high prices of materials and labour have had a depressing effect. Speculative building to a great extent has almost stopped, and until the price of materials is brought down it will remain very quiet. The housing problem has come to the front, and is likely to become more acute if this diminution of speculative building continues.

The past year will show a falling-off in the output of slates, both in Carnarvonshire and Merionethshire. Trade in the former district was brisk throughout the year, but in the latter there was a slight falling-off in the spring, owing to foreign competition. The quarry owners, however, by adjusting prices, recovered the trade.

In the iron, steel and kindred trades the past year has been a prosperous one for manufacturers of finished iron and steel, who have been busy with home and repeat orders. During the last few months, however, fresh business has been difficult to obtain, and a general weakening of prices has commenced. Indeed, Messrs. Bolling and Lowe, of Laurence Pountney Hill, E.C., in their annual trade review, think manufacturers are likely, for a time at any rate, to make further concessions. Last year's output of coal is expected to exceed that of 1899, and to approximate 230,000,000 tons, in spite of enhanced prices. Of this quantity about 60,000,000 tons have been exported, and the remainder, 170,000,000 tons, consumed at home by industrial concerns, railways, gas works, &c. In consequence of the advanced cost of fuel, makers of finished materials have naturally raised their prices, and the foreign consumer has doubtless paid for the increased value of about 100,000,000 tons of coal—say £25,000,000. Every additional advance of one penny per ton on the price of coal means on the total output about £1,000,000 extra profit. Wages in the South Wales collieries are now higher than they have ever been. The "boom" has passed, but these cycles of prosperity are not so beneficial as is imagined, owing to the enormous speculation, not by consumers, but by a certain trading class with little or nothing to lose, and everything to gain, and by outsiders who simply want to "spec." All parts of the world can be reached by steamer from Europe within six weeks, with the exception of the Northern Pacific Ports, and large stocks are only kept as a speculation. The tendency now seems the other way, *i.e.*, to keep as small supplies as possible, as, in the opinion of the trading community, the capital locked up and loss of interest are not sufficiently compensated by the value of merchandise held in stock, which has to be disposed of at varying values in the unknown future.

The continued increase in all branches dealing with electric energy is a matter for congratulation. Its advantages as an illuminant, and as the tractive force for tramways and railways, are increasingly appreciated, and our manufacturers are finding electrically driven machinery more effective, speedier and cheaper than was the case with steam. Colliery companies have made considerable advance in its adoption, for mining the coal and lighting the workings.

As usual, the railway rates cause much dissatisfaction, carriage on all material being excessive when compared with what our foreign competitors pay. A new question has arisen which should be carefully considered, whether the English railway companies act in their true interest in buying their rails and rolling stock abroad, provided such can be obtained upon reasonable terms at home. By purchasing from the foreigner they are depriving numbers of British workmen of employment, not only in the handling of the raw material, but of the manufactured articles also. It is not the few pounds so saved by a company which will materially improve its financial position, but in doing its utmost to assist the British manufacturer in dealing with the rate question, and in finding employment for the workmen who form the backbone of the railways' customers. The mileage in the United Kingdom is now about 23,000, having cost about 1,100 million sterling. Considerable progress in the construction of light railways has been made, and is the beginning of a much-needed development.

ENGLAND.

Birmingham.—The building trade in this district has suffered the same as in others from depression owing to the high price of materials. In the engineering and iron and steel trades the high-water mark, both as regards demand and prices, had practically been reached when the year opened. Quotations moved up a little after then, but not much. At the beginning of 1900 marked bars were advanced 10s. per ton, bringing them up to £11, as compared with £8 at the corresponding period of the previous year. Unmarked bars were also risen 10s. to £10 10s., as against £6 10s. at the opening of 1899. Other descriptions of iron appreciated in equal ratio, the stimulating cause being the increase in the price of coal, and wages Throughout the year these items have marched steadily forward, until they have reached a pitch at which speculation has been strangled, and remunerative business is next to impossible. Producers of steel sheets and pig iron all participated in the good times of last year, and the early part of the present, galvanised corrugated sheets, delivered in Liverpool, realising in March as much as £15, black sheets, doubles, £11 to £11 5s., and Bessemer billets, £7 5s. to £7 10s. The war provided a great deal of work for this district, and many establishments were carried along at a rattling pace in consequence. The rush of orders had spent itself by the end of June, but for the next two months there was not much scarcity of employment. Ironworkers' wages, under the sliding scale, were increasing hand over hand, and coal was also rising in value, and these two factors are mainly responsible for the present condition of affairs. A serious blow was aimed at the trade by the railway companies in September, when they increased their siding charges, and reduced the free demurrage period.

Blackpool.—The Borough Surveyor's annual report on the work done by the Building Plans Committee of the Blackpool Corporation states that during the twelve months ending Oct. 31st last, 429 houses were erected and certified for human habitation (a decrease of 54 over the previous year), being at the rate of 1·17 houses per day for the whole year, or 1·37 per week day. During the past decade, the annual number of houses built in Blackpool has been as follows:—1891, 330; 1892, 259; 1893, 320; 1894, 447; 1895, 531; 1896, 744; 1897, 984; 1898, 1,066; 1899, 483; and last year, 429. Over 4½ miles of 6in and 4in. drains have been laid to new buildings during the last twelve months. At the present time, 240 dwelling-houses are in various stages of erection, besides churches, schools, stables, coach-houses, workshops, alterations, &c.

Bradford.—The great activity which marked the local stone and building trades in the early part of the year 1900 seems to have declined gradually down to comparative quietness, Whether the extension of the city boundaries and the additional tramway facilities will bring about a partial revival remains to be seen. Some of the principal contracts let during the year and now in progress are those in connection with the Cartwright Memorial Hall, the new Fire Brigade Station, the new Conditioning House, the extension of the Electricity Works, the large tramcar shed at Thornbury, the Green Lane Board Schools, the extension of the Bradford Provident Industrial Society's premises in Sunbridge Road, and alterations at the Old Brewery premises in Brewery Street. Of projected new public buildings may be named the new Corporation baths in Morley Street and Drummond Road, district police offices and fire stations, and the extension of the Rawson Place Market, while the extension of the Town Hall is receiving increased consideration. The Lancashire and Yorkshire Railway Company have let the contract for a large warehouse in Bridge Street, to cost about £60,000. House building has gone on at a rapid rate in many parts of the city, especially in the districts of Horton Grange Road, Lidget Green, Bradford Moor, and Eccleshill. There is a lull now, however, in this class of building. The local stone trade, though brisk during the first half of 1900, has fallen off considerably during the latter half, but the London trade has been fairly good during the year, and continues so. The following are about the prices which have ruled during the past twelve months, the figures varying somewhat according to quality:—Self-faced flags, 2in. thick, 2s. 4d. to 2s. 6d. per superficial yard; 2½in., 2s. 10d. to 3s. 2d.; and 3in., 3s. 6d. to 3s. 10d. Tooled flags, 2in. thick, 3s. 6d. to 3s. 9d. per superficial yard; 2½in., 4s 6d. to 4s. 9d.; and 3in., 4s. 8d. to 4s. 10d. Ashlar, 1s. 8d. to 2s. 2d. per cubic foot. Outside wallstones, 44s. to 54s. per rood; inside ditto, 22s. to 24s.; and pitch faced, 44s. to 50s. Common bricks, 25s. to 30s. per thousand at works. There has been a steady demand during the year for timber, and prices have been well maintained.

Bridlington.—In 1899, 293 plans were sanctioned by the Council for the erection of dwelling-houses. In 1900, 276 house-plans were passed. Of these 80 per cent. have been or will be erected in the Quay Ward and Hilderthorpe Ward. During the past year 184 houses have been certified by the surveyor as fit for human habitation, so that there has been only a little less briskness in the building trade in 1900 than in 1899.

Bristol.—The continued high prices of materials and the increase in the rate of wages in all branches of the building trade have combined to very considerably lessen the volume of business done in this district in the last few months, and the trade has by no means realised expectations. Many contracts in and around the city are rapidly approaching completion, and very few are in contemplation in the immediate future, so that the prospects are not very hopeful. Speculative building has for the same reasons been practically stopped, and until there is an appreciable decrease in prices it is hardly likely to revive. The supply of labour is abundant in all branches, and the difficulty experienced earlier in the year in obtaining materials is not now felt.

Coventry.—Taken altogether the local builders were fairly busy in the last twelve months. There were not so many plans approved as in either of the previous four years, but the number of buildings completed was in excess of any year in the history of the city except 1898. Last year the number of plans approved were 636, of which 488 were for houses, and, curiously enough, of the buildings completed—643—488 were houses. The record for house erection is held by 1898 with 501, and 1900 is a good second. The following is a summary of building operations collected by the city engineer:—

Plans Approved.

	Year. 1899.	1900.
Houses	528	488
Factories and Workshops	26	11
Alterations and Additions	163	106
Miscellaneous	89	24
Public Buildings	0	1
Churches	0	1

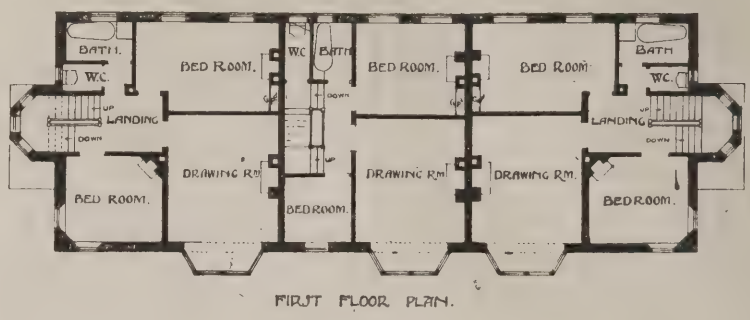
Miscellaneous	21	26
Public Buildings	0	1
Churches	0	1
Chapels	1	0
Schools	1	2
Streets	9	11
Totals	612	643

During the year 304 plans were laid before the General Works Committee, 52 of them being disapproved. At present matters are somewhat flat owing to the unsatisfactory condition of the cycle industry, and it is possible that the supply of houses, just now, is in excess of the demand. Overcrowding, of which so many evils were predicted three years ago, has, except in a few isolated cases, disappeared, but the great increase in habitations does not appear to have done much towards emptying

areas which the annual reports of the medical officers of health, in the last twenty years, consistently described as insanitary. Builders have fought shy of putting up cheap dwellings. In the direction of Foleshill available spaces are being rapidly occupied, and it cannot be long before the north of the city is as thickly covered as the eastern quarter of Hill Fields. Foleshill is making great commercial progress, and in places already exhibits as busy an aspect as many parts of Coventry. The builders there have been and are erecting fairly rapidly, and the coming year promises a continuance of activity. Just outside the boundary, on the south side of the city, Lord Leigh is disposing on lease of 170 acres of land. The ground is situated in and near the Canley Valley—a most attractive site—and there is a likelihood of early building.

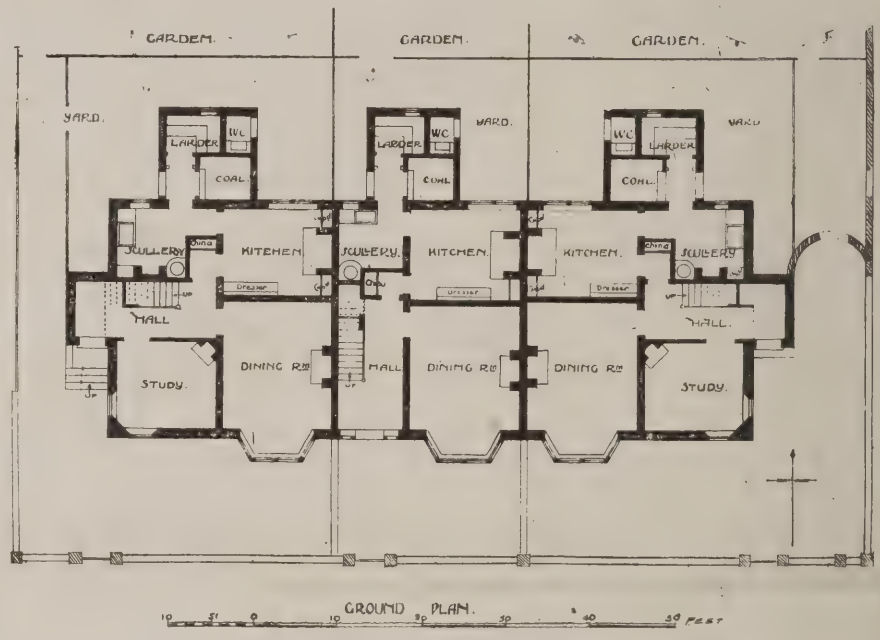
Gateshead.—The growth of this town has been more rapid during the past twelve months than in any similar period of the history of the borough.

Halifax.—The building trade has been quiet as compared with previous years. A number of men are at present unemployed, those at work being mainly engaged in the erection of houses and cottages.



Hessle.—This township rapidly advanced during the year. Builders have been busy everywhere. Westward many villa residences have been erected, whilst on the new estate, comprising the corner of the Ferriby Road and the Wear, a new post office and grocery and provision stores have been built, and a branch by the York Union Banking Company, Limited. The Hessle Institute Company's new premises on the same estate are almost completed. The east of the village has not been neglected. Messrs. Simons and Sawyer have erected several houses of the working-class type. The industries, of which the chief are the chalk quarries, shipbuilding and brickmaking, continue to find employment for a large amount of labour.

Huddersfield.—The building trade has been in a fairly satisfactory position, but few large works are in prospect for this year. Up to November plans had been approved by the Corporation of 273 dwelling-houses (against 259 in the year preceding), 60 business premises, and 193 miscellaneous buildings. The chief work for this year is the erection of the lunatic asylum at Storthes Hall, near Kirkburton and the extension by the Co-operative Society of their premises over the site of the present Victoria Temperance Hall in Burton Road.



Hull.—Building in this city has been exceptionally brisk during the past year. A great deal of house property has been erected, particularly in the outskirts of the city, owing to the service of trams which has been in operation for the past eighteen months. A large area has been been cleared of slum property, and blocks of artisans' dwellings are being put up by the Corporation. The year has been free from serious labour disputes. The outlook is good.

Leeds.—The year has been more satisfactory than 1899. For the first time for some years it has been free from trade disputes. It is true the Tyneside dispute has brought a disturbing element at the close of the year. There the bricklayers struck work in May last for an advance of wages from 10d. to 11d. per hour, and though the Northern Centre of the Masters' Federation, to which the Yorkshire masters are affiliated, have taken the matter up, there would seem to be no strong disposition locally to push matters to an extreme by locking out the Leeds bricklayers in sympathy. Trade, therefore, has been very brisk during the year. In the last month or so there has been a hesitancy to let new contracts, the architects preferring to await a fall in prices. This fall, so far as certain classes of material are concerned, has already begun, but timber retains its abnormal price, and it is said that no substantial reduction will be made until the reopening of the Baltic ports. Since March 25th, 1900, which marks the beginning of the official year, 2,342 new houses have been erected and completed in Leeds. The approximate number of

TERRACE HOUSES

H. G. IBBERSON, ARCHITECT (For perspectives see Centre Plate).

miscellaneous buildings erected and certified during the same period is 2,021. The improvement of Briggate continues, and with the completion of the fine line of new buildings at the top of the hill and of the new arcade, probably the finest in the north, the character of the street will be further changed.

Leicester.—During the past year the building trade in this town has been active. During the year ending September last plans were passed for 1,451 houses, and the total number of plans passed for new houses, factories, alterations, &c., has been 2,910.

London.—The year's business at the London Property Mart has been very unsatisfactory. The principal feature of the year has probably been the increased sales of medium class property, for which there has been a good and steady demand. Landed estates and large West-end properties have been altogether out of favour. Freehold building land promises to have a record season. Several large estates, more particularly on the East Coast, have been prepared for disposal "in a marquee on the estate," while London suburban building land, especially in the northern districts, is so much in demand that few, if any, "eligible building plots," have been left unsold from last season, and many new estates have been surveyed for the purpose of being laid out for disposal in plots. The want of vigour which has generally characterised the London Auction Mart is probably due to a certain timidity on the part of vendors—which, in turn, is perhaps due to the war—and to the consequent falling off in the supply of properties for sale. Generally, however, it may be said that for such properties as have been offered there has been a fair demand, and prices have been well maintained. For 1899 the total of the sales at the Mart was £6,290,314, whilst for 1900 it was only £4,934,769, a decrease of £1,355,545. In addition to the sales at the Mart, however, many prominent transactions have been carried out by private treaty, and a number of important sales have been held in the provinces.

Manchester.—The building trade has been brisk throughout the year. Many builders had large contracts in hand at the beginning of the year, and during the twelve months the prices of materials in all branches of the trade rose so rapidly that contractors in many instances sustained serious losses. Otherwise builders have scarcely any other reason to complain. Wages have maintained a high standard, and the workmen have enjoyed uninterrupted prosperity. The erection of the new station for the Lancashire and Yorkshire Railway Company at Bolton has cost £300,000. The prospects for the coming year are said to be satisfactory.

Newcastle.—Locally, the employers and workmen engaged in the building trades have enjoyed prosperity during the past year. However, 1900 will be remembered as a disastrous time by many builders in Newcastle and Gateshead. Owing to the bricklayers' strike contractors have been unable to complete their undertakings. But, judging by the number of dwelling-houses erected during the year that has closed, few of those builders in a smaller way of business seem to have been much affected by the stoppage. In the west end considerable progress has been made in opening out the Fenham Estate; in the neighbourhood of Benwell a large number of new streets have been erected; and at Jesmond, Gosforth, Byker, and Heaton great additions to the available house accommodation have been made.

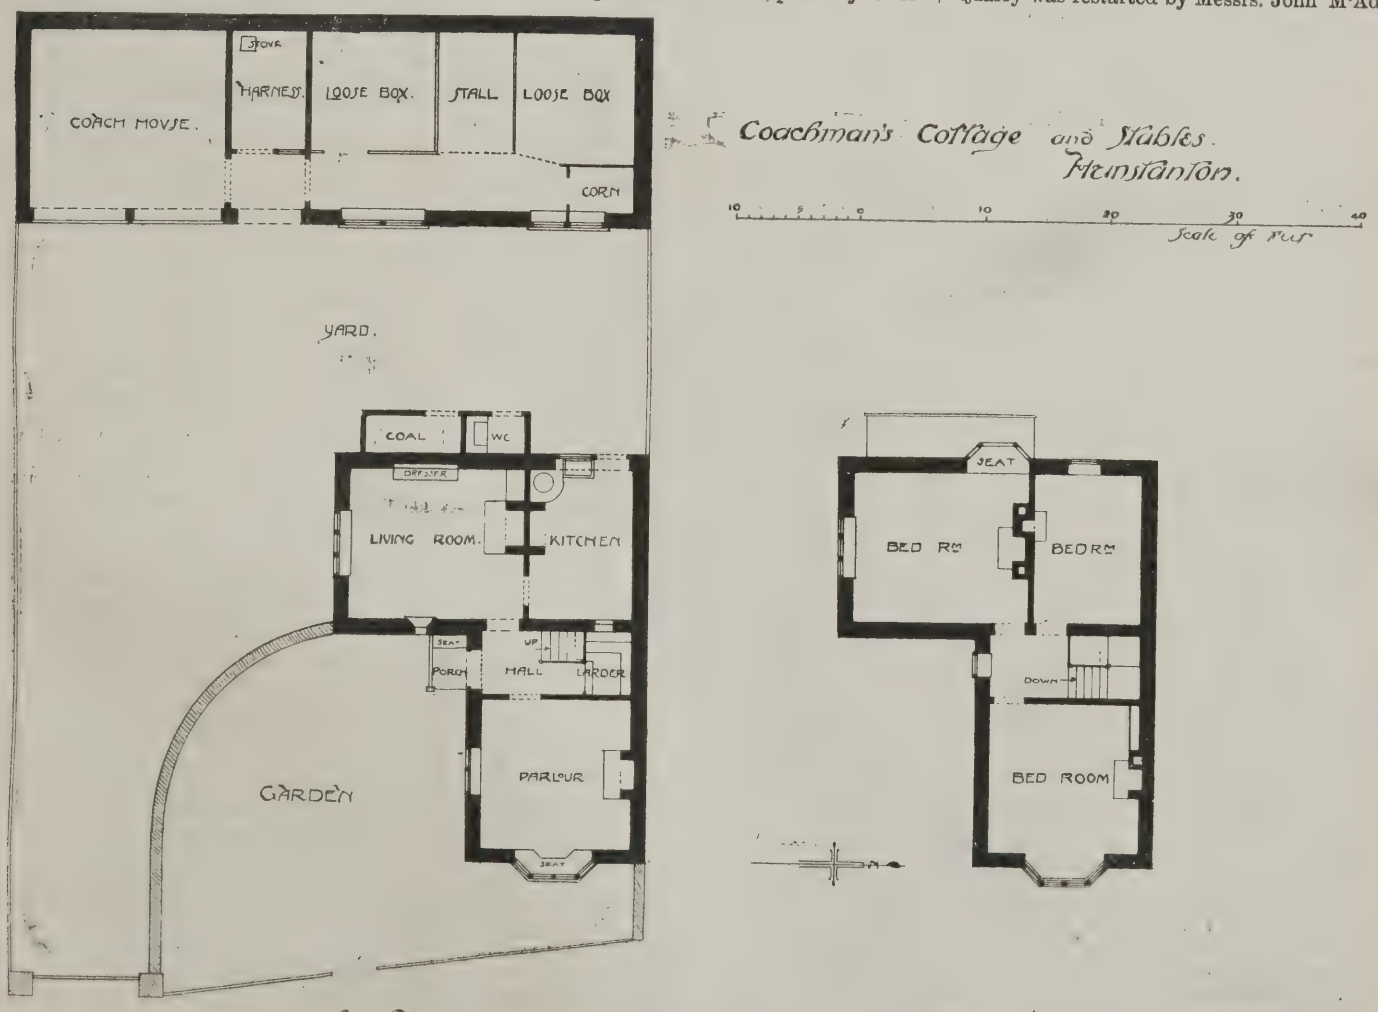
Scarborough.—The trade has been prosperous. The Corporation, alive to the importance of preserving Scarborough as a progressive health and pleasure resort, in addition to the main undertaking, the Marine Drive and

Promenade, which, though slowly, is surely approaching completion, have several important public works in hand; these include the transformation of St. Nicholas' House into a Town Hall, the erection of a fire station and an infectious diseases hospital, and several much-needed works of street improvement.

Sheffield.—The abnormal increase in building operations recorded last year has been strongly maintained during the last 12 months. There has been a slight decrease in the number of houses erected during the year, but the falling-off is more than accounted for by the special circumstances which existed in 1899. The approximate number of houses certified for occupation during the past year was 2,797, as against 2,616 the year before—*i.e.* an increase of houses certified of 181. During the year 1,365 plans for all classes of buildings have been deposited, as against 1,474 in 1899, a decrease of 109. In regard to street and sewage works 32 plans have been approved. These plans have involved or will entail the making of 5,051yds. of streets with sewers. There have also been sent in 18 plans for sewers alone, and these will necessitate the making of 564 yards of sewers. The total extent of streets with sewers and sewers alone approved during the year thus amounts to 5,615yds., or over three miles. Coming to minor buildings, we find that 92 plans for such erections as cowsheds and stables have been approved during the year, as against 99 last year. Plans for warehouses, workshops, &c., have numbered 654, as against 477 in 1899. The summary of statistics shows that the number of plans deposited for houses has fallen off by 1,200, and plans for other buildings have increased by something like 180. Nine hundred and seventy of the plans which have been deposited have been approved. The outlook for the future is not promising. The feature of the year's operations has been the decrease in the building of house property and the increase in the erections of workshops. The cause of the promised slump in the local building trade is principally the high price of materials. Towards the end of last year prices went up, and it is not expected that there will be an abatement of prices for some time to come. Bricks are especially dear, a fact that is directly due to the high price of coal. Prices of iron work are also high, and exhibit a very firm tendency, and there is no prospect of a decrease in the rates for timber. Another thing which militates against large profits is the action of the Corporation in regard to the erection of buildings. A number of new clauses are to be found in the by-laws this year, which will entirely do away with any chance of cheap building, though some builders may take advantage of the fact that some of these clauses do not come into operation until October 31st of next year. During the year an important combination of the men's building organisations has taken place in South Yorkshire and the immediate district, and this may have some effect on wages. The strike of builders throughout the country has not affected Sheffield very much.

York.—The erection of new buildings has also been very brisk. Most of the houses have been erected on the new estates in Bishopthorpe Road, South Bank, Huntington Road, Leeman Road, Burton Lane, and Acomb Road. 236 plans have been submitted during the year, of which 170 have been passed, comprising 656 houses, 114 warehouses, outbuildings, &c., 59 alterations and additions to premises, 12 new streets and back roads, and 11 public buildings.

SCOTLAND.



Aberdeen and Aberdeenshire.—The year has closed in marked dulness so far as the building trade is concerned. 1899 also closed in a period of depression, but with this important difference that the preceding months of the year were unusually flourishing from an architectural point of view. This year there has been no such early run of prosperity to back up a bad ending. Money has not been over plentiful, and the speculative builder, probably realising the risks of over-stocking the residential requirements of the city, has been holding his hand a bit. The new houses and shops added to the city during the year numbered 334, as against 450 in 1899. The statistics as to the plans passed by the Town Council in 1899 were as follows :—

New houses and shops	395
Alterations and additions	86
Warehouses, stores, &c.	55
Estimated value	£410,000

The following are the statistics for 1900 :—

New houses and shops	251
Alterations and additions	91
Warehouses, stores, &c.	68
Estimated value	£293,949

The depression which characterised the closing months of 1899 has thus never lifted during the year now closing. While alterations of, and additions to existing property were more numerous than in 1899, the total number of plans of new houses and shops sanctioned in 1900 shows a decrease of 144, while the total estimated value works out at £116,051 less than last year. Quarrying in Aberdeenshire continued to develop in extent and importance. The past year has been one of the most prosperous in the history of the industry in this part of the country, and from present appearances the prospect is bright in the extreme. One feature in connection with the production of Aberdeenshire granite which will probably be very notable in future will be its use as polished fronts for buildings. Already a considerable market for these fronts has been opened up in southern towns, and several granite merchants in the city have been busy with these in the course of the year. A large proportion of the granite quarried was used up in the manufacture of setts, for which there was a great demand throughout the year. The sett-making department has had a most prosperous year. During the year new quarries were opened up at Badentoy, and settmakers are employed there, while new quarries have been opened up or extensions made in various districts. A new quarry was opened at Kemnay, while Cove Quarry was restarted by Messrs. John M'Adam

H. G. IBBERSON, ARCHITECT (For perspective see Centre Plate).

and Sons, who have also purchased the estate of Cummings Park, and are about to start a new quarry there. Mr. James Leith intends in a short time to commence sinking a new quarry at Cairncry, while Messrs. A. and F. Manuelle are at present engaged pumping the water out of a disused quarry at Dancing Cairns, where a very fine quality of stone is obtained. As far as wages are concerned, drillers and quarrymen, for whom there was great demand, were paid at about the same rate as last year. During the year the Quarrymen's Union was dissolved. At the beginning of the year the settmakers received a rise in prices on various sizes of setts.

Brechin.—In the building and kindred trades business has been on the whole very quiet, for while one or two fairly big jobs have been going on employers have been depending more on work in the surrounding country to keep their men going. The restoration of the Cathedral has been pushed on during the year, and has given employment to a large number of men. The nave and aisles are now finished as far as the joiner, slater and mason work are concerned. The interior, of course, has not yet been touched, while the choir and north aisle are being pushed on. On the whole the operatives promise to be fairly busy for some time to come. Work in the quarries during the year has been somewhat intermittent, and a good many of the employees have either found employment elsewhere or taken up new occupations.

Dundee.—As in 1898 and 1899, the past year has been one of the busiest ever experienced in the building trade in Dundee, but it is to be feared that the same will not be the case during 1901. The demand for the year was mostly in the direction of villas, a large number of which were erected in the northern and eastern ends of the town. For tenement property, however, there was a great falling-off, and it is stated that a crisis has now been arrived at in this connection. For some time back it has been evident the city was being over-built, but the high-water mark has now been reached, hundreds of houses standing empty. Very few contracts for new property are, in consequence, being entered into. Under the Corporation, contracts of extensive character have been carried out under all departments. At present, the buildings being completed for the town are the new Fire Brigade Station, the hospital at King's Cross, and the reconstruction of the gasworks. Several public improvements in the matter of the widening of streets have also been carried out. During the year a long strike by the operative masons took place against a proposed reduction of their wages, but they had eventually to agree to a reduction of ½d. per hour. Not long ago the master builders gave notice of 1d. reduction in the men's wages to take effect in February next.

Inverness.—For a good number of years there has been a boom in the building trade in Inverness. Now, however, the inevitable "slump" has come, and for the last year or two there has been a feeling amongst moneyed people in the town that it is sufficiently built. The result now is that comparatively little building has been done during the past year, and that only that was necessary. Fortunately, there has been some stir in the country, and the workmen have been able to get employment elsewhere. Many of them have been working at the huge extensions to Skibo Castle, which are being carried out by Messrs. Ross and Macbeth, architects, Inverness. There have been a few big jobs going on in Inverness, although generally speaking trade was quiet.

Leith.—During the year 84 applications for warrant to build were reported on at the Dean of Guild Court, compared with 91 the previous year. Several of the largest of the buildings which were for speculative purposes, including blocks of tenement houses, have, however, never been prosecuted further. On the whole, the year has been a quiet one compared with 1899, which was marked by exceptional activity. In the latter part of the year especially, the erection of new buildings apparently received a check, and the masons' strike, occurring as it did when a lull in the trade had taken place, has most likely deterred many beginning operations until the spring of this year. The erection of villas in the Trinity district has continued, but on a much more moderate scale; and in South Leith several large blocks of dwelling-houses have been constructed. Work in the Dean of Guild Court during the last three or four months has diminished very much; and the absence of plans for any large buildings before the Court shows that there is a prospect of quietness in the building trade during the winter especially.

Perth and Perthshire.—There is no distinguishing feature in last year's building operations. The end of 1899 saw a number of important buildings in course of erection. Of these some are still in progress. The principal buildings of last year include a large cooperage and store in Gray Street, the new Central District School in Meal Vennel, and laundry and gymnasium accommodation for the Caledonian Road School. Two large blocks of Workmen's dwellings at Old High Street have been completed, and are now occupied, and large additions are in course of erection. This scheme is the realisation of a long-spoken of and much-needed improvement—the widening of Old High Street. Seven large blocks of tenements have been in course of erection, chiefly in the northern district. During the year 14 double villas have passed the Court, a large proportion of these being in the Craigie district. Many alterations and additions have been made to property in the town, and a large addition is to be made to Messrs. Pullar's dyeworks. The year has not been as good as recent years, although fairly active.

Peterhead.—The local building trade shows signs of great activity. Several new buildings have been completed in the course of the year. The building trades altogether have had a busy time, and the prospects are good for next year.

St. Andrews.—The building trades in the city have been busy throughout the year, and the prospects for the current year are fairly good. New ground has been opened up at the west end of the town within the area of the recently extended burgh boundary, and a number of smaller-sized villas are being erected.

IRELAND.

Trade having generally improved has of course affected the building trade slightly for the better. The Board of Works maintains its high record as an effective and far-reaching minister to the multifarious necessities of the country. The total sum advanced during the year on various loan services (£436,237) was distributed as follows:—Improvement of farms by landlords and tenants, £64,421, of which £33,529 was advanced to the former, and £30,892 to the latter class; acquisition of glebes and erection of national school teachers' residences, £22,784; improvement of labourers' dwellings, £56,387; lunatic asylum buildings, £73,215; housing of the working classes in towns, £54,800; public health loans for water supply, roads, lighting, &c., £121,504; miscellaneous, £43,126. The outlay in connection with the Parliamentary votes for the erection and maintenance of public buildings was nearly £200,000.

Belfast.—Here the building trade has not been as prosperous as in the previous year. The cause of the present state of dulness is the fact that there has been a strike in the carpentering branch, lasting for eight months, and it is a matter for regret that a settlement has not yet been arrived at. There has been no great change in prices, with the exception of iron work. Steel and iron girders, used so largely in building operations, owing to the advanced price of coal, have also increased during the year very much; but there is, however, a downward tendency in the price of iron. There are not many new buildings in the centre of the city. The Bank Buildings have almost been completed. The City Hall can now partly be seen by passers-by, as the massive walls are becoming visible. The Cathedral building in Donegall Street is also progressing favourably. There is also a large suite of buildings being erected in Wellington Place for shops and offices. Numerous additions to factories, warehouses, &c., have been carried out. Quite a number of churches have been built. These include the church on the Malone Road for the Fisherwick Place congregation, the Methodist Church, Ballymacarrett, and St. Silas's Church, Oldpark Road. The Mater Infirmoram Hospital has now been completed, and a good start has been made at the new Royal Victoria Hospital. With the prospect of a settlement in the carpentering branch in the immediate future, trade will considerably improve.

Omagh.—Few towns in the North can lay claim to having made equal progress with Omagh in the way of building within the past few years. A general transformation seems to have taken place. Old thatched cabins have disappeared, and their sites in many instances have been usurped by modern and far more pretentious dwellings, while showy shop fronts and signboards all bear witness to an era of progress. The most notable feature, however, in the way of extension is the erection in such large numbers of what we shall term the better class of artisans' dwellings. The completion of the new bridge across the Strule will undoubtedly give a further impetus to building on the Cappagh side of the stream.

Current Periodicals.

Pall Mall Magazine.—By publishing the article on Rodin in the January number the proprietors hope to promote the success of the scheme now on foot to buy one of the great French sculptor's bronzes for presentation to South Kensington Museum. Professor Legros, Mr. Sydney Colvin, Mr. Sargent, R.A., and Mr. Swan, R.A., are among the subscribers. Rodin's work and the criticism it has evoked are remarkable, and the heroic way in which the sculptor has fought and conquered the bitter hostility of contemporary opinion is most inspiring. In 1864 Rodin sent his head of "The Man with the Broken Nose" to the Salon, where it was refused "because of its originality." He waited thirteen years before again submitting his work—"L' Âge d'Airain." It was accepted; and thus after first being accused of too great originality and, later, of too faithful realism, Rodin was received by his censors. In 1898 the statue of Balzac was exhibited at the Salon, ordered by the Société des Gens de Lettres, and refused by them because they "failed to recognise Balzac in the statue"! This statue is totally different to what we are accustomed and exhibits an astonishing crudeness in handling; but as you gaze on it you perceive that it is indeed a masterpiece, perfectly representative of Rodin's methods. "I am seeking always," he says, "the distinguishing trait that makes this man or woman an individual different from the rest of his kind. When I discover this *trait marquant* I dwell upon it, I insist on it—I caricature it, if you like—until my bust has likeness; then I know that I *know* my model." This is his whole creed, and it should be kept in mind when gazing on his wonderful sculptures. For fifteen years Rodin has been engaged on his *chef d'œuvre*—the famous "Porte de l'Enfer" ordered by the Museum of Decorative Art in Paris. The portal is six mètres high and the panels and borders are filled with countless figures in bas and high relief. The doors are to be cast in bronze and are all but in the hands of the casters.

Cassell's Magazine for January includes an article on the generation of electricity at Niagara. The Power House, about a mile from the Falls, contains ten dynamos, representing an aggregate of 50,000 horse-power. Current is delivered at a pressure of 11,000 volts and taken twenty miles away to Buffalo, there to drive cars, light houses and work factories.

The Antiquary.—In the church of Lostwithiel, Cornwall, there is a most curious old font. It is most likely thirteenth-century work, though Dr. Lanyon, in a paper on the "cabalistic bas-reliefs" of this font, places the date as early as the days of King Arthur. "This is far too early a date . . . . the ornamentation, the dress of the knight with his prick-spur, and the fact that the bowl is octagonal in shape, all indicate a date not earlier than the year 1200"—so says Mr. Alfred C. Fryer in the

January issue of this magazine, which also supplies some particulars about Gogarth Abbey, Llandudno.

The Genealogical Magazine for January reproduces two illustrations of Thornbury Castle, in the valley of the Severn.

The British Clayworker.—In an article in the December issue attention is drawn to the fact that in spite of the undoubted progress that has been made in the manufacture of architectural terra-cotta, particularly during the last ten years, many of the old-time defects may still be found—though less pronounced in character—existing in low-grade wares of to-day. "A perfect body, either for glazed or unglazed terra-cotta, when burnt, should be close, hard and compact, regular and somewhat fine in grain, with low powers of absorption; not liable to crack, and not particularly prone to distortion." The western end of the London Basin is the district dealt with in the December issue in the series of articles on "The Brick-earths of Great Britain." The following joke is worth reprinting:—"And what sort of bricks have you in your country?" said the lecturer to a student from South Africa the other day. "Oh, they are well enough," replied the student; "they break if you let them fall on to the ground, or hit them too hard, but when they are covered with stucco at the front and wallpaper at the back they do well enough."

The Land Magazine for December contains two articles dealing with the housing question. The writer of the first, on "Healthy Homes," says that farmers complain that workmen are difficult to find, and will not come at all unless they can have a good cottage and garden. We often hear this. Why should they? They are quite right. The writer's conviction is that if you treat the labourer properly, give him a good cottage and a good garden, and give his children the same educational advantages they would have in town, you will go a long way towards keeping him in the country. From the second article, on "Housing and Overcrowding in France," we learn that it is one-third cheaper—the taxes being less—to live outside Paris. The Municipal Council places every obstacle in the way for preventing citizens immigrating to the environs, by keeping out local lines of railways and extending no favour to tramways. There are 70,000 houses in the city.

The Home Counties Magazine for January is a most interesting number for architects. There is first of all an illustrated article on the Whitgift Hospital at Croydon, which was begun in 1596 and completed three years later. In spite of the many changes which it has undergone, and deprived as it is of its once ample surroundings, there still remains the main building of the hospital in its entirety, and it is of every importance that this should be preserved. The small school-house and the schoolmaster's house, which formerly stood adjacent to the main building, are now gone. Mr. Bickley supplies an interesting article on Compton Church, Surrey, a building which affords antiquarians splendid subjects for debate, for it has a double chancel, one above the other; a remarkably early wooden screen; a most curious turret staircase with retiring room at the base; and two hagioscopes. Another article of interest deals with the scheme adopted by the two Hertfordshire archæological societies (the St. Albans and the East Herts) for the preservation of those ancient buildings in St. Albans which possess archæological or historical interest. They have compiled a list of about twenty of these buildings, and hope to add lists relating to doorheads, carvings, and other details. Mr. F. G. Kitton, the honorary secretary of the Hertfordshire Art Society, will be glad to forward printed register forms to anyone willing to supply information on the subject. Among the "Quarterly Notes" in the issue under review is one relating to the proposal of an Essex clergyman to ring the bells of his church by electricity, and to apply the proceeds of his ingenuity to the "restoration" of the building. We can fancy, says our contemporary, what would be the reverend inventor's idea of restoration!

Architectural Association Notes.—Referring to the Holborn-Strand designs, Mr. William A. Pite remarks in the December number that "there was much to admire both in design and draughtsmanship, but that is not architecture, while more than one competitor pronounced keen disappointment at 'the miserable show'; but, apart from this, as detached fragments of architectural motif, much that was admirable was shown in a brilliant and enlightening manner. Anyway, the professional journals seem to be having a good time over it, and duplication is approaching to suffocation." That was not kind of Mr. Pite! In the January number Mr. J. M. Brydon contributes a review of nineteenth-century architecture in England, and Mr. J. Maclaren Ross' prize essay on the life, work and influence of Sir William Chambers is also printed.

The Architects' Magazine is the Journal of the Society of Architects in its new garb. It is more chatty than its predecessor, though it loses somewhat in dignity. A number of illustrations of architectural models made by Mr. John B. Thorp are given. Mr. Thorp is very successful as a model-maker, and his two models of the Brook Hospital and the North-Eastern Hospital exhibited at the Paris Exhibition are very ingenious pieces of work. Architectural models might be much more frequently employed than they are.

HOUSE AT MUNICH FOR HERR FRANZ STUCK, ARCHITECT.

The Artist.—The best reproductions in the Christmas number are those of the works of Mr. Edwin A. Abbey, R.A., who holds such a high place as a painter and is undoubtedly the finest living pen-draughtsman. Some of Mr. James J. Guthrie's mysterious designs are also shown in this number.

The Quarry.—A leader in the December issue, dealing with the deplorable Penrhyn quarries dispute, concludes as follows: "The only thing to be feared in the present crisis is that America may be able to take advantage of the position, and gain such a hold upon the slate trade of this country as to permanently affect the prosperity of the industry." This is exactly what America is beginning to do in the iron trade. Two articles in this issue deal respectively with the geology of County Donegal, and an automatic hydraulic plant for the manufacture of artificial cement stones.

Journal of Decorative Art.—The issue for January is an interesting one. The articles include one on "Early Italian Fresco Painters," another on the decoration of that weird building the German pavilion at the Paris Exhibition, and another on the influence of the gourd on ornamental forms. In a retrospect of 1900 the writer says: "The prospects for the New Century are bright in the extreme. It is an impossible thought that we could ever by any mischance revert to the sloughs of the 'forties' and 'fifties' of this century. The need is for some man of strong genius and individuality to weld into one harmonious whole the floating mass of beautiful ideas which threaten to overwhelm us by their multiplicity and fecundity."

Master Builders' Associations' Journal.—In the January issue a good deal is said in favour of the affiliation of the national associations of various trades connected with the building industry with the National Association of Master Builders of Great Britain and Ireland—a matter which will come before the annual meeting of the Federation at the end of this month. Regarding the recently-issued report of the Chief Labour Correspondent of the Board of Trade on the strikes and lock-outs of 1899, our contemporary remarks:—"The information conveyed shows how tight the grip of the trade union is upon the masters' business, and indicates, too, if employers are not alive to the situation that that grip will be tightened, in many instances to throttling point."

The Stones Trades Journal completes the first six months of its existence with a number (that for December) full of useful information. Articles are given on a Yorkshire stone *mine*, the use of tiles in business premises (a most desirable adaptation), "Scandinavian granites," artificial flag machinery, the active and inactive ingredients of cement, and electricity as power for cranes and travellers. At the conclusion of the article on cement the writer gives a few words of caution about what have been termed inactive ingredients. An excess of sulphuric oxide may indicate adulteration with gypsum. Carbonic acid shows that some of the lime is still in the form of carbonate, and that the cement is probably underburnt. Magnesia in excess must also be looked upon with suspicion. Insoluble silica must be classed among the inactive ingredients, and an analysis of cement ought therefore to state how much of the silica is soluble and how much is insoluble.

The R.I.B.A. Journal, dated December 8th, gives full details of a new system of practical perspective for artists and architects, by the Cavaliere Settimio Giampietri (of Rome). We shall publish a critique of this system shortly. Mr. Paul Waterhouse contributes a well-balanced criticism of that many-sided man, Coventry Patmore, who has lately found so excellent a biographer in Mr. Basil Champneys, and Mr. Arthur Cates continues his series of articles on architectural education, on this occasion dealing with the Department of Architecture at the Massachusetts Institute of Technology, Boston, U.S.A. In his review Mr. Waterhouse says: "It is in accordance with this law (i.e., that sculptured ornament should exist only upon such members as are obviously free of special stress) that the best styles avoid the enrichment of the shafts of columns, and while encouraging sculpture on a frieze are sparing in its use on an architrave. The blossoming-out of capitals is no infringement of the rule. The foliage at the summit of a Corinthian or Gothic shaft stands for a kind of testimony

that the pier, having done its duty from the base upwards in sufficiency of strength, is free at its head to show a symbol of rest—the resultant of a margin of energy." This is not completely logical.

The Brickbuilder (Boston, Mass.).—It is stated in the November issue that the various brick companies of New England are about to unite for the better management and control of the trade, and it therefore seems opportune to establish a uniform standard of size for the common brick. The American brick is supposed to measure 4in. by 8in.; its thickness varying from 2¾in. to 2½in.; consequently, it is difficult to obtain bricks by which two headers and a joint can be made to equal one stretcher. A uniform size is therefore a great desideratum. The number under review contains the first of a series of articles on Byzantine brickbuilding. Among the plates are plans and perspective of the Burbank Hospital at Fitchburg, Mass. (Kendall, Taylor and Stevens, architects).

The Architectural Review (Boston, Mass.).—Writing on "The Authorship of Architecture" in the November issue of this magazine, Mr. Russell Sturgis insists that architecture is not and cannot be the individual work of anyone. "In fact, the glory, the special delight and charm of architectural art, the one thing which raises it to a rank equal to that of mural painting or of stately sculpture, is this combination of many talents, of many personalites, of many minds in the production of one vast work of associated art." He becomes perturbed about the true sources of design in Wren's numerous and important works, asks how much Michael Angelo had to do with the design of the Farnese Palace, and makes the very deplorable, though perfectly accurate, statement that the active architect of to-day, once in his office, is compelled by the pressure on him on every side to put his studies and the memorandum which served for them into the hands of a highly-paid, trustworthy subordinate. But there is still a career, says Mr. Sturgis, for the artistic architect who shall prefer the certainty of a moderate fortune and happy labour to the possibilities of great semi-commercial success. Among the illustrations are two of the competitive designs for the United States Custom House at Baltimore, M.D., both Classic designs of considerable merit.

Carpentry and Building (New York).—Illustrations of eight of the Pan-American Exposition buildings are given in the issue for January.

Architecture (New York) is a supporter of the movement for architectural registration, and prints in its December issue the sections of the New York State Architects' Registration Law. The same subject is referred to in the article on architectural assistants. In America there is the same complaint of the profession being filled with assistants devoid of the qualities that are necessary for an architect. And the same complaint is made of parents and guardians hastily placing their charges in architects' offices with only a vague idea of what they are doing. Then we have the panacea. "The statutory registration of the profession is the only practicable means by which the overcrowded assistant can be protected and his position insured." Our contemporary very wisely emphasises the fact that without a sense of vocation for art, and without a naturally studious and persevering mind, the profession of architecture is a poor one to depend on; and we are now speaking of those who are thrown into it, without either of these qualifications.

The American Architect—Of the illustrations to the issue for December 1st two are worthy of mention—the house of Herr Franz Stuck at Munich, and a large country house at Cold Springs Harbour, Long Island, N.Y. (Carrère and Hastings, architects); the former is a stone building severely Classic in treatment, but very pleasing in the mass. We give an illustration of it on the previous page. The best building illustrated in the issue for December 15th is an English one, namely, the Italian Hospital in London, as reconstructed from Mr. Cutler's designs. In the issue for December 22nd is printed the president's address at the Convention of the American Institute of Architects. There is much of interest in it, and we hope to publish a summary, dealing with the main points raised, very shortly. Of the plates in the issue under notice is one of an apartment house in Central Park West, New York, by J. E. Ware and Sons, and H. S. S. Harde. This building is six storeys high, of brick and stone, with curved bays on each side running from basement to roof, the centre portion being slightly recessed. The effect is good.

Stone (New York) supports a scheme for a National Association of Quarrymen in America. There was such an association about ten years ago, but it is now extinct, hence this new proposal. We wish that this magazine printed more original articles and less from the columns of other journals.

The Canadian Architect and Builder.—An experiment in regard to colour as applied to architecture is being made with the buildings now in course of erection for the Pan-American Exposition at Buffalo, New York (see page 433 and centre plate). These buildings, like those at Chicago and Paris, will be constructed of steel covered with staff, and it has been decided to colour the exteriors under the direction of Mr. C. Y. Turner, of New York. The predominating colours will be ivory tints for the walls, with decorations in delicate shades of blue and green; all domes, minarets, &c., to be gilded, and the buildings roofed with metal stamped to represent Spanish tiles and painted a dull rich red. It is presumed that the colour will be applied, as at Chicago, by means of a spraying apparatus. The result will be interesting to note.

The Irish Builder is now reduced in price from threepence to one penny per copy. This begins with the issue for January 1st.

La Revue de l'Art Ancien et Moderne.—Paris Exhibition art exhibits fill the greater part of the issue for December. The remainder of the space is devoted to the work of Alexandre Lunois, an artist of no special consequence.

Berliner Architekturwelt.—This magazine is remarkable for the outrageous illustrations which it publishes; but the buildings shown in the December issue are comparatively moderate in conception—that is, they are not covered with crawling, wriggly, spidery details, the emblems of freedom degenerated into utter licence. The chief merit of the modern buildings of Germany is their originality, or rather novelty. For instance, in the Tietz stores in Berlin we see figures about 20ft. high on each side of the entrance, and also near the top of the central block, while the whole front to Leipzigerstrasse consists of sheets of plate glass fixed between girders. On the Krausenstrasse façade there is an entrance about 30ft. high from the ground to the crown of the arch. Halfway there is, apparently, a huge girder, about 4ft. deep, the space above and below being filled with plate glass. This is not architecture. German towns are being filled to-day with the unrestrained work of cranks and harebrained novelty-mongers. The January issue contains an illustrated article on the Golgotha Church in Berlin and some characteristic examples of modern German street architecture. The drawing of "Old Berlin" is so inferior that it is not worth printing as a plate.

New Patents.

These patents are open to opposition until February 12th.

1899.—Making Grooves in Wood, &c.—24,062. R. BOUGHTON, 87 Rosendale Road, West Dulwich, and J. E. SMITH, 91 Rosendale Road, West Dulwich, London, S.E. The object of this invention is to form grooves and channels (generally of a semi-circular or segmental form) in wood and other materials with as little waste as possible. For this purpose saws or planes are employed corresponding to the section desired. They are provided with a knob by which the cutting edge can be pressed round, enabling the material to be removed in one piece—instead of being shaved out, as is ordinarily done.

Material for Sewage Filter Beds.—25,239. S. BALDWIN, Bethesda Street Iron Works, Burnley. This invention consists of a self-contained machine having one pair of coarse-grooved breaking rollers, one pair of finer-grooved crushing rollers revolving at a faster surface speed, and a cylindrical screen. The apparatus is particularly adapted for dealing with the refuse ashes and clinkers from furnaces, rendering them suitable for use in sewage filter beds.

1900.—Bacterial Treatment of Sewage.—550, R. F. W. SMITH, 89 Bartholomew Close, and the Pioneer Investment Trust, Ltd., 11 St. Mary Axe, Leadenhall Street, London. After the sewage has been bacterially treated ozonised air (that is, air impregnated with ozone) is forced into the effluent, causing sterilisation and destroying any disease germs that may possibly be in the effluent.

Pile Drivers.—2,534. H. H. COCHRANE and A. H. COCHRANE, both of 39 Victoria Street, Westminster, S.W. In steam pile-drivers on the Lacour system the piston rod is solid and projects through the lower end of the cylinder resting on the top of the pile and the cylinder acts as the monkey, working up and down on the piston rod, being supplied with steam by a flexible pipe. This pipe rapidly wears out and it is the object of the present invention to remedy this defect. The piston rod therefore projects through both ends of the cylinder, the lower part being solid and resting on the pile (as in the Lacour system) and the upper part being hollow and receiving steam at its upper end.

Combined Square and Plumbing Instrument.—15,901. F. FONTANELLA, San Remo, Italy. This invention consists of a hollow set-square in which is pivoted a weighted needle that moves over a dial on the face of the square. A surface is only plumb when the needle points to zero.

Plaster Slabs.—19,608. C. W. T. EUSTANCE and J. D. COLLEY, Sandleheath, Fordingbridge, Hants. This invention relates to the manufacture of finished plaster in sheet form for internal work, requiring no setting coat, and also as a handy and cheap material for use outside as a substitute for brick, wood, or iron in temporary structures. The material consists of a mixture of plaster of Paris, 22 parts; water (containing a 5 per cent. solution of common salt), 44 parts; hair, 4 parts; oak sawdust, 15 parts; and shavings or horn parings, 15 parts. If for external use, the sheets are dipped in or thoroughly coated with creosote or tar.

Iron Staircases.—20,055. S. LION and W. STERN, jun., both of the firm of W. STERN, jun., AND CO., Feuerbach, Germany. The frames supporting the treads are so connected with one another by means of bolts that the stairs may be arranged to any desired curve without altering the form of the supporting parts.

The following specifications were published on Saturday last, and are open to opposition until February 19th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—22,549, GOSTLING, FRASER AND BOOTH, manufacture of cement. 22,775, HODKINSON AND HODKINSON, presses for forming and closing the sockets of shovels and spades. 24,758, NIENSTAEDT, screw taps. 24,759, NIENSTAEDT, die stocks. 24,812, REESE, manufacture of blocks and slabs from granite, slate, and other refuse. 25,124, BOULT (*Mahler and Friebe*), smoke-consuming fireplaces, stoves and furnaces. 25,202, KIMMAN, pneumatic drills. 25,281, LANE, electrical traction on the closed conduit system. 25,407, PHIBBS, holders for electric incandescent lamps. 25,734, TIMOFEEFF, artificial stone and cement. 25,739, FROYCK, pressing or moulding glass.

1900.—936, MOULD, frame stands for lavatory basins. 1,754, INGLESON, guards for circular saws. 2,451, PORTWAY AND GRAHAM, lifting jacks. 2,897, CHAPMAN, electric railways on a surface-contact system. 6,497, SMITH, lavatory basins. 8,839, FISCHER, dovetail-threaded taps, nuts and joints. 9,754, SABINE, appa-

ratus for conveying sanitary pipes and other similar articles from place to place. 12,498, ISTVAN, SZALAY AND JOZSEF KOROM, scaffolding. 12,715, LINKLETER, revolving cowls. 13,177, THOMSSEN AND THOMSSEN, tube for lining deep bore-holes. 14,751, BRUNSCHWYLER AND PÄRLI, acetylene apparatus. 18,406, GRANT AND GRANT, junior, guards for circular saws. 18,502, WALSER AND CARTIER, acetylene-gas apparatus. 19,225, LANDEKER AND ALBERT, process for the production of seamless branch pieces for piping. 19,515, LEBIODA, process for rendering wood fireproof and rot-proof. 19,728, HÜPPI, lifting jacks. 19,774, CROPPI AND EDANT, apparatus for flushing water-closets. 20,275, WERTHEN, mixing appliance for incandescent gas burners. 20,341, CARPENTER, means for lighting gas burners. 20,657, SMITH, moulding presses.

Surveying and Sanitary Notes.

The Construction of Subways.—The question of the construction of subways for all kinds of mains, drains, cables, and ducts has been much discussed, and the advisability of constructing such urged. In all new leading thoroughfares in the City, and generally in the metropolis, subways form part of the plans for the construction of the streets; an eminent engineer who has given some attention to the subject has estimated that the expenditure involved in carrying the scheme into effect would amount to £20,000,000. But there can be no doubt that something will eventually have to be done on a similar scale in order to avoid the great nuisance now occasioned by the constant tearing up of the streets: and the sooner the better.

The Cost of London Improvements.—The Tramways and Street Widenings Bill of the London County Council, which would authorise the Council to construct new tramways, to reconstruct and alter tramways, to work tramways by electric traction, and to make new streets and street improvements, estimates the amount which the Council will require to expend on capital account for the purposes of the measure as follows:—For new streets and street improvements and works connected therewith, £1,188,000; for the construction of new tramways and reconstruction of existing tramways and other tramway works by this Bill to be authorised, and for purchase of land for a generating station, £957,000, or £2,145,000 in all. The length of the tramways proposed to be laid down is upwards of 28 miles. In the case of quite a number of properties the Council propose to take a portion only for the improvement or widening of the roadways—forecourts, gardens, or private pavements, for example—and certain of the councils of the metropolitan boroughs are to be called upon to contribute towards the expense of some of the improvements. The estimate of gross expenditure under the General Powers Bill of the Council is £177,450, the proposals embodied in the measure including a widening of Central Street, St. Luke's, and of Brixton Road, near Kennington Park; the acquisition of land for sites for fire brigade purposes; further lands for the purposes of the Rotherhithe and Ratcliff Tunnel; and purchase of lands for an extension of Brockwell Park.

Incorporated Institute of British Decorators In connection with this Institute the headquarters of which are at the Old Painter's Hall, Little Trinity Lane, London, a Northern District has recently been formed. The district comprises the counties of Northumberland, Cumberland, Westmoreland, Durham, Yorkshire, Lancashire, and Cheshire, and commenced its work with the New Year. The principal objects of the Institute are to elevate the decorator's craft and to improve the status and qualifications of its members. This will be done by disseminating information among the members, arranging lectures, and holding examinations to test the fitness of candidates for admission to membership of the Institute.

Keystones.

Mr. G. F. Watts, R.A., has joined the Labour Association for promoting co-partnership among the workers.

Craighlaw House, Kirkcowan, has been renovated and improved by Mr. Charles S. S. Johnston, architect, Edinburgh.

St. Peter's Church, Port Isaac, has had a new stained-glass window erected in the chancel. The window is a single lancet light.

Wemyss Bay United Free Church.—Three stained-glass windows have been introduced into the chancel. The windows have been executed by Messrs. Clayton and Bell, of London.

The National Photographic Record Association.—Mr. George Scamell (hon. secretary) has presented 103 photographs of the historical houses of London, and Mr. T. Bolas has made a present of photographs of old Newgate, to this association.

Old French Church at Waterford.—A fund is being raised for repairing the ruins of the old French Church at Waterford, the burial place of the family of Lord Roberts, who highly approves of this method of showing appreciation of his services to the Empire.

A Handy Calendar for 1901 is issued by that well-known firm of ventilating engineers, Messrs. Robert Boyle and Son, Limited, of Holborn Viaduct. It is printed in gold on a piece of imitation ivory, the opposite side having scales. The calendar is enclosed in a neat paper case and is of a very handy size—about 3¼in. by 1¾in.

New Bradford City Architect.—A sub-committee meeting was recently held to consider applications for the post of City Architect. There were originally 70 candidates, of whom six had been requested to appear before the committee. Eventually the appointment was given to Mr. F. E. P. Edwards, A.R.I.B.A., one of the chief assistants engaged in the City Architect's department at Liverpool.

Workmen's Dwellings in Newcastle.—The Town Improvement Committee of Newcastle Corporation recently considered the question of providing accommodation for poor families who have been displaced by the city improvements at Ouseburn Bank. It was decided to approve the plans, which were before the Committee recently, for a new block of buildings in Albion Row. The block will contain accommodation for a large number of families in sets of two and three rooms.

A Lady Decorator.—With an efficient staff of workpeople under her control, some of whom have worked for her for many years, Mrs. Cox (Mabel Larkins), of 82 High Street, Hampstead, N.W., is prepared to undertake all kinds of interior decoration and furnishing; she will also be glad to submit designs and schemes of decoration for church work. Mrs. Cox has lately furnished and decorated Mr. Hamo Thornycroft's house at Hampstead, a fact which had the effect of creating a general demand for her services.

Glasgow Royal Infirmary Competition.—In connection with the recent limited competition for plans for the reconstruction of the Glasgow Royal Infirmary, Mr. Hippolyte J. Blanc, architect, Edinburgh, one of the competitors, has received a letter from the City Chamberlain informing him that when the envelopes of the unsuccessful competitors were opened, his set of drawings bore the letter "B," which received three votes as being first in order of merit. The following are the authors of the respective designs, with the approximate costs as estimated by Mr. Robert Whitson, the committee's measurer:—

A—Sydney Mitchell and Wilson, Edinburgh	£303,000
B—Hippolyte J. Blanc, Edinburgh	269,000
C—Malcolm Stark and Rountree, London	252,000
D—John James Burnet, Glasgow	219,000
E—James Miller, Glasgow	241,000
F—H. E. Clifford, Glasgow	238,000
G—H. Percy Adams, London	321,000
H—A. Hessel Tillman, London	245,000
I—Campbell Douglas and Morrison, Glasgow	225,000
J—T. L. Watson and H. Mitchell, Glasgow	235,000

A Statue to the late Senor Canovas has been unveiled in the Senate Square, in Madrid.

The Bells and Belfry of the Church of Exhall Parish have just been restored. Many other improvements in the church have lately been made.

The Peterborough Cathedral Restoration Committee have issued a notice regretting that the funds are exhausted, and that they are compelled to stop the works until further subscriptions are forthcoming.

Highgate Archway.—The last portion of the old Highgate Archway has now been removed. The memorial stone recording the fact that the first stone of the arch was laid on October 31st, 1812, has also been removed. Great difficulty was experienced in the demolition, owing to the manner in which the work was carried out. Portions of the old arch were so solidly put together that it was like hewing rock.

The New Admiralty.—It has been decided at last to complete the quadrangle of buildings at the back of the old Admiralty, and Messrs. Leeming and Leeming, the architects, who have the carrying-out of the first and second blocks, are now busily engaged upon the drawings for the third, and in the course of the next two or three weeks the work of excavating for the foundations will be commenced.

A New Drill Hall at Talgarth for the F Company, 1st V.B. South Wales Borderers, has been opened. It was erected at a cost of £365. The designer was Mr. James Gunter, Glasbury, the contractors being Messrs. J. P. Games, Fred Morgan, and Levi Pugh. The building is 52ft. long and 36ft. broad, and is built with best red brick front, sides of corrugated iron, and lined with felt, and match-boarded throughout.

The New War Office Building.—The First Commissioner of Works has entrusted to Mr. Clyde Young the carrying-out of the plans for the new War Office buildings which his father, Mr. William Young, had in hand at the time of his death. Mr. Clyde Young understood every point of his father's intention, and the architectural design will be realised by him under the close superintendence of Sir John Taylor, consulting surveyor to the Office of Works.

The Gobelins Manufactory has just completed a series of magnificent tapestries, woven in silk and wool, on which it has been engaged for twelve years. The Elysée Palace, the National Library, the Versailles Museum, and the Archives, Paris, are to benefit by these works of art, which include reproductions of famous pictures by Le Brun and Boucher and an original composition, representing a tournament, by M. Jean Paul Laurens.

The Church of Sacré Cœur, at Montmartre.—The rare Sienna marbles which are to be used in the construction of the high altar of the Montmartre Basilica or Church of the Sacré Cœur have arrived in Paris. The marbles have been specially chosen by M. Rauline, the architect of the church. The construction of the altar is expected to take five months. The money spent on the basilica up to the present time exceeds £1,400,000.

Mr. George Smith, who was at one time a well-known exhibitor at the Royal Academy, died last week in his 72nd year. When a very young man, having shown much promise as a student in the Academy schools, he attracted the notice of the late C. M. Cope, R.A., and was engaged by him as an assistant in executing some of the frescoes for the House of Lords; but he soon passed from "historical" to "domestic" art, and quickly became known for his pictures, mostly of cabinet size, more or less in the manner of Wilkie and Webster.

The Architectural Association held a meeting last Friday evening, Mr. W. H. Seth-Smith, president, in the chair. Messrs. H. W. Clapson, C. L. Gill, H. J. Rippon and K. D. S. Robinson having been elected members, a vote of condolence was passed to the family of the late Mr. H. C. Boyes, F.R.I.B.A., as past-president of the Association. Messrs. R. Weir Schultz and Beresford Pite lectured upon the subject of "Hints for the Preparation of Studentship Drawings," reports of which are, owing to the great pressure on our space, held over till next week's issue.

New Companies.

Bethesda Granite Quarries, Limited.

This company was registered on December 12th, 1900, with a capital of £2 000 in £1 shares to acquire the business of granite merchants, quarry owners, miners, smelters, mineral and metal merchants, engineers, contractors, &c.

London and County Contracts, Limited.

This company was registered on December 17th, 1900, with a capital of £5,000 in £1 shares to carry on the business of estate owners, builders, contractors for railways, tramways, and public works, &c. The first directors (to number not less than two nor more than four) are to be appointed by the subscribers.

Marble and Lithographic Stone Development Syndicate, Limited.

This company was registered on December 17th, 1900, with a capital of £20,000 in £1 shares to adopt an agreement with F. G. Bate and others to acquire certain inventions, to manufacture and deal in artificial marble, lithographic stones, and materials used in connection therewith, and to obtain chemically pure lime and carbonic acid gas.

D. W. Richards, Limited.

This company was registered on December 17th, 1900, with a capital of £5,000 in £1 shares to acquire the business carried on by D. W. Richards, at Marlborough Road, Newport (Mon.), and to carry on the business of builders, contractors, decorators, stone, sand, lime, brick, timber and hardware merchants, &c. The first directors (to number not less than two nor more than eight) are to be appointed by the subscribers.

John Stow, Limited.

This company was registered on December 12th, 1900, with a capital of £6,000 in £1 shares to carry on the business of joiners, carpenters, shopfitters, shop-front builders, masons, builders, timber, stone, sand, brick and hardware merchants, contractors, &c. The first directors (to number three) are J. Stow, F. J. Liversidge, and W. H. Bottomley. Registered office: Teakwood Works, 3 Free Street, Bradford.

Bedlington Brick Company, Limited.

This company was registered on December 13th, 1900, with a capital of £5,000 in £1 shares to acquire a leasehold brickfield at Bedlington, Northumberland, and to carry on the business of brick, tile, and pipe manufacturers, &c. The first directors (to number not less than three nor more than five) are J. Brassell, T. Shevels and A. Bramley. Registered office: Bedlington Brickworks, Bedlington Station, Northumberland.

B. Ward and Company, Limited.

This company was registered on December 12th, 1900, with a capital of £35,000 in £1 shares (17,500 preference) to acquire the business carried on at Westminster as B. Ward & Co. and to carry on the business of concrete experts, wood block and mosaic flooring manufacturers and contractors, &c. The first directors (to number not less than two nor more than five) are A. J. B. Ward and S. H. Blackstone (both permanent).

Bischof White Lead Corporation (1900), Ltd.

This company was registered on December 12th, 1900, with a capital of £350,000 in £1 shares to acquire the business of Bischof's White Lead Syndicate, Limited, including its patents for the United Kingdom, Austria, Austria-Hungary, Belgium, France, Germany, Spain, and the United States of America, and to manufacture and deal in lead, white lead, paint, varnish, oils, pigments, &c. The first directors (to number not less than four nor more than 10) are R Mond, E. L. Pease, J. F. Pease and J. F. L. Brunner.

Carsluith Granite Company, Limited.

This company has been registered in Scotland with a capital of £10,000 in £1 shares to acquire the lease of a quarry and lands near Creetown, Kirkcudbrightshire.

Anglo-Norwegian Quarry Company, Limited.

This company has been registered in Scotland with a capital of £10,000 in £1 shares to prospect and work lands, quarries, mines, &c. Registered office: 45 Renfield Street, Glasgow.

C. E. Harris and Co., Limited.

This company was registered on December 20th, 1900, with a capital of £500 in £1 shares to carry on the business of builders, contractors, merchants, farmers, property owners, financiers, &c. Registered office: Rose Villa, Sandhurst, Berkshire.

Bowes Ganister and Freestone Company, Limited.

This company was registered on December 13th, 1900, with a capital of £1,700 in £50 shares to quarry and deal in ganister, freestone, &c., and to lease or otherwise acquire the ganister or freestone within and under certain land on Bowes Moor, Yorkshire.

Lucas Brothers, Limited.

This company was registered on December 13th, 1900, with a capital of £13,500 in £1 shares to acquire the business carried on at Dunston, near Gateshead, as Lucas Brothers, and to carry on the business of firebrick, fireclay goods, and cement manufacturers, coal, coke, and manure merchants, dealers in lime and building materials, iron merchants, &c. A. Lucas is the first director.

Bingham Patent Paving Company, Limited.

This company was registered on December 17th, 1900, with a capital of £50,000 in £1 shares, to adopt an agreement with J. E. Bingham, and to carry on the business of paviors, granite, stone, timber, and wood merchants, contractors, patent owners, &c. The first directors (to number not less than three nor more than seven) are C. Wardlow (chairman), J. Grant, R. Thompson, H. W. Dibnah and E. T. Scammell.

George F. Arney, Limited.

This company was registered on December 14th, 1900, with a capital of £5,000 in £1 shares, to acquire and carry on the business of timber and wood merchants, &c., carried on by G. F. Arney at 57-59 St. George's Road, Southwark, S.E. The first directors (to number not less than two nor more than three) are G. F. Arney, T. W. W. Torckler and J. H. Rowntree. Registered office: 59 St. George's Road, Southwark, S.E.

Bradley Brothers, Limited.

This company was registered on December 13th, 1900, with a capital of £15,000 in £1 shares (5,000 preference), to take over the business of whinstone, ironstone, and limestone merchants, quarry and mine owners, paviers, &c., carried on at Great Ayton and elsewhere in the county of York, and at Stockton-on-Tees, Durham, as Bradley Brothers. The first directors (to number not less than two nor more than five) are J. Hedley, F. W. Chadwick, G. Bradley, T. Bradley and M. H. Bradley.

Webster's Brickworks Railway Company, Lim.

This company was registered on December 10th, 1900, with a capital of £10,000 in £5 shares to acquire a railway recently constructed or in course of construction, leading from a point near Coventry, on the Coventry and Nuneaton branch of the London and North-Western Railway, to a point in or near Stoney Stanton Road, Coventry. The first directors (to number not less than three nor more than seven) are F. Warwick, H. Webster, G. H. Thynne and W. H. Harris. C. S. Irby, Webster's Brickworks, Limited, and Aubrey, Seaman and Co., Limited, have certain rights of nominating directors.

Quarry Notes.

Newfoundland Slate.—John W. Edwards and A. T. Hughes, slate manufacturers of Granville, N.Y., have returned from a trip to Newfoundland, and they express themselves as much pleased with the slate prospects. A syndicate, in which Granville parties are interested, is now at work there.

Slate at Killaloe.—There is a range of low hills beginning at Ballyglass and continued on through Corbally, the Arrah Mountains, to Killaloe, all of the same geological formation. Excavations have been made at various points along this line, and in every instance excellent slate was unearthed. Want of capital, or enterprise, or improvidence on the part of managers led to the closing of all except one, the present highly successful Killaloe Slate Quarries. Although called Killaloe they are six miles from it, and a similar distance from Nenagh, both railway towns. There is another quarry open, but unworked, which belongs to an English company, which pays a rent of £40 for its unused rights. This is called Gap Quarry, is about half a mile from the Killaloe Slate Company's quarry, and is said to be just as good as the latter. The slates are carted by local farmers to short distances, but excellent facilities of transit are given by the Grand Canal Company, which has a quay or wharf at Garry Kennedy, about two Irish miles distant. The boats ply between Dublin and Limerick. At the Killaloe company's works there are about a hundred hands employed, and there is ample work for as many more if they could be had. The slates are excellent in quality, command a good price, and cannot be supplied, at least sometimes, for a considerable time after being ordered. Indeed, scarcity of workmen is the principal difficulty that the company has to meet.

COMING EVENTS.

Wednesday, January 9.

GEOLOGICAL SOCIETY OF LONDON.—Meeting at 8 p.m.

INSTITUTE OF SANITARY ENGINEERS.—New Year's Presidential Address.

NORTHERN ARCHITECTURAL ASSOCIATION. — Mr. Allan Greenwell, F.G.S., A.M.I.C.E., M.S.I., on "Bitumen: Its Application in Architecture and Engineering," 7.30 p.m.

CONTRACTS OPEN.

HORNSEY URBAN DISTRICT COUNCIL.
TO BUILDERS AND CONTRACTORS.

The Hornsey Urban District Council are prepared to receive TENDERS for the ERECTION of BUILDINGS for a Branch Public Library at Highgate.

Plans and specifications may be seen, and copies of the quantities, forms of Tender, and all information obtained on application to Mr. E. J. LOVEGROVE, Surveyor to the Council, at the Offices mentioned below, on any morning between the hours of TEN and TWELVE o'clock, on a sum of Two Pounds being deposited with the Clerk to the Council, which sum will be retained by the Council and deemed to be forfeited if a bonâ-fide Tender is not made by the depositor.

If a Tender is made which is not accepted, the sum deposited will be returned, and if a Tender is accepted, such sum will be retained by the Council until the contract has been executed by the depositor, and will be forfeited in the event of his or his sureties failing or neglecting to execute such contract or the bond accompanying the same within seven days after he or they respectively shall have been requested to execute the same.

No Tender will be considered except on the prescribed form.

Sealed and endorsed Tenders are to be delivered or sent by post so as to be deposited in the Tender box in my department not later than FOUR o'clock, p.m., on MONDAY, the 21st day of JANUARY proximo. The quantities duly completed must accompany the Tenders.

The Council reserve to themselves the right to decline all, or any, or any portion of the Tenders so sent in.

By order,
F. D. ASKEY,
Clerk to the District Council.

Offices: Southwood Lane,
Highgate, N.
December 1900.

EAST SUSSEX COUNTY COUNCIL.
TO BUILDERS.

TENDERS are invited for the ERECTION of a SESSIONS COURT, with Magistrates', Solicitors', and Witnesses' Waiting Rooms and Offices; and POLICE BUILDINGS, consisting of Residences for a Superintendent, Sergeant, and three Constables; Charge Room, Four Cells, and Stabling, at Bexhill, in the County of East Sussex, for the East Sussex County Council.

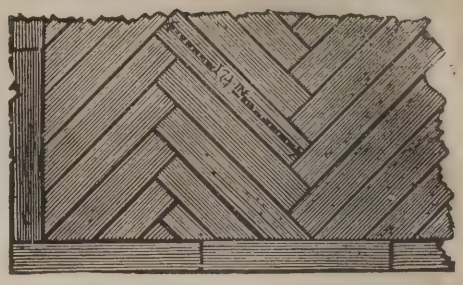
Plans, specifications, and conditions of contract may be seen at the County Surveyor's Office, County Hall, Lewes, on and after THURSDAY, 10th JANUARY next, between the hours of TEN a.m. and FOUR p.m.; SATURDAYS, TEN a.m. and ONE p.m.

Quantities may be obtained after THURSDAY, 10th JANUARY next, on application to Mr. F. J. WOOD, County Surveyor, County Hall, Lewes, and on payment of a deposit of a £5 Bank of England note, which deposit will be returned on receipt of a bonâ-fide Tender.

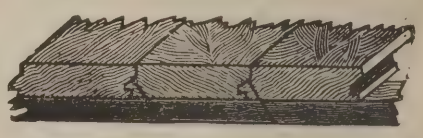
Tenders, endorsed "Tender for Sessions Court and Police Buildings, Bexhill," to be addressed to F. MERRIFIELD, Esq., Clerk of the County Council, County Hall, Lewes, and delivered not later than FRIDAY, 25th JANUARY, 1901.

The County Council does not bind itself to accept the lowest or any Tender, and will not pay any expenses incurred in connection with the preparation thereof.

FRED. J. WOOD, Assoc.M.Inst.C.E.,
County Surveyor.



County Hall, Lewes,
December 1900.



Can be fixed close up to Purchaser's boundary, and suits rise or fall in the ground.

An Architectural Causerie.

The Picturesqueness of Thatch. In roaming the highways and byways of the country we occasionally come upon some interesting revivals of old building styles and customs. Would that such finds were less rare in these days of the imported London fashions that are rendering many provincial towns smaller and worse copies of the metropolis, and even setting up in the villages and hamlets things alien to the spirit and custom of the countryside. There are those—all honour to them—among architects who perceive the peculiar fitness of local style, and see that that style, wherever it may be found, is an outcome of old local conditions, and illustrates very clearly the story of shire, town, village, or hamlet. It was the peculiar merit of that consummate artist, the lamented Sedding, that he not only saw the beauty of such styles and treatments, but had the artistic and mental agility and versatility that enabled him to enter into the spirit of the thing in the restoration work or original designs that fell to him to do. The granite churches and mansions of Cornwall, the parclose screens and the beautiful carved pulpits that render Devon so notable, were safe in his hands, and we may be sure that thatch appealed to him. Thatch is the oldest of roofing materials, but the tourist who in these latter days wanders in the West, where it most did flourish, will find that even there it is being gradually replaced, and largely, be it said with regret, by slates, tiles, or by that most abominable of materials, corrugated iron. Now it has ever been the experience of cottagers living under thatched roofs that they are warm in winter and cool in summer; and with these very practical advantages thatch also carries the recommendation, from the artist's point of view, that it is extremely picturesque. It is decidedly not cheap in the making, but it is lasting, and is not so inflammable as has been supposed, although of course not without ready possibilities of ignition in very dry seasons. It is an exaggerated idea of its liability to being burnt that has led to thatch becoming rarer year by year; for it is becoming more and more the practice of landowners to insist, when renewing leases to farmers, upon their replacing old thatch with other roofing materials upon any new roofing being required. Thus the farmers have no choice in the matter; nor have the cottagers, who are almost always in favour of the warm and comfortable winter roofing of straw or reed that their fathers and grandfathers knew so well. It is thus that the thatcher's trade is fast becoming an extinct industry, and one may enquire for a professional thatcher in many a West of England village and not find one, and when found he will always prove to be an old man. No young man learns thatching as a trade nowadays, even though there are yet ricks to be covered. It is in the midst of these changes that the writer, quite by chance, discovered the new post-office at Witchampton, near Wimborne, in Dorset, illustrated on this page. Entirely a recent building, it owes its existence in this form, and with the old-fashioned roof-covering, to the taste of Lord Alington, directly outside of whose place at More Crichel it stands. The thing is notable enough to induce others to go and do likewise, but it would not be surprising to learn that what Lord Alington's taste leads him to induce the Post Office to erect outside his own park gates he forbids in his dealings with his tenants. Still, the example is a good one.

C. G. H.

Studentship Drawings. THE question of draughtsmanship in its relation to architecture, which has quite recently been the subject of some discussion in our columns, was extensively dealt with by Mr. R. Weir Schultz and Professor Beresford Pite at the meeting of the Architectural Association held on January 4th, when hints were given on the preparation of studentship drawings. The question is an old one. Mr. Schultz contends that for the last thirty years or so "mere draughtsmanship" has been held up to architectural students as a fetish, this being largely due, first, to the fact that the architectural drawings at the Royal Academy have been judged by a committee consisting largely of painters; secondly, because the younger generation copied Mr. Norman Shaw's draughtsmanship without also acquiring the mastery of composition and construction which it displayed; and, thirdly, because architectural competitions generally have fostered the production of showy drawings. Though one agrees with Mr. Schultz that draughtsmanship, as such, should occupy a secondary place in the preparation of studentship drawings (which must be considered from an educational and not a pictorial standpoint), the true solution of the problem lies perhaps between the two extremes of disdain for and worship of draughtsmanship. The standard set up for the student should be one which, while primarily requiring that his drawings should show that grasp of design and knowledge of construction which are essential qualities of good architecture, would not regard the draughtsmanship as so much superfluity. After all, the ability to draw is not everyone's, and it needs to be recognised just as much as the ability to paint or to carve: it is often those who are miserable draughtsmen who raise the hue and cry against technique. Mr. Schultz and Professor Pite come into collision on certain points. For instance, Mr. Schultz contends that the student should prepare his drawings as if they were going to be carried out, should give particular attention to all the practical details, and should not set out a perspective from an impossible point of view. According to Professor Pite all this is working to a visionary end, for the designs will never be carried out; and this being so the student should be as original and as imaginative as he can, "taking an imaginary standpoint rather than an actual one." Surely this is not very good advice, and from a Government professor too! If the student develops on these lines he will find when he arrives at actualities that architecture is not picture-making, and the proficiency he has attained in designing monumental buildings, ducal palaces and splendid houses helps him but little with the £800 villa which he has been commissioned to build. Mastery of proportion and planning, knowledge of construction—these first most certainly; but, in addition, as much draughtsmanship and technique as you are capable of—the more the better. So that, as has already been stated, it is the happy medium between the two extremes which affords the solution of this most vexed problem; and the drawings of William Burges and Mr. Norman Shaw may be taken as examples of such work.

Glasgow Royal Infirmary Competition. CONSIDERABLE dissatisfaction is being expressed in regard to the action of the Executive Committee of the subscribers to the Queen's Diamond Jubilee Fund for the reconstruction of the Royal Infirmary at Glasgow. The competition for this work has recently been decided and the result has already been announced in our columns. Dr. Rowand Anderson was the assessor. He placed first the plans marked "F," which were those of Mr. H. E. Clifford, of Glasgow, estimated to cost £238,000 to carry out; but, for some unaccountable reason, the committee have decided by a majority of one (11 votes to 10) to accept the plans (marked "E") of Mr. James Miller, of Glasgow, by whom the reconstruction will be undertaken, at an approximated cost of £241,000. We are now not concerned with the relative merits of these two designs but with the main principles involved by the committee's action. The story about the old man and his donkey has a very practical modern application—with competitions this is especially true, for it is indeed impossible to please everyone. But here there is good reason for complaint. What is the use of appointing an assessor, paying him a large fee to adjudge the several designs submitted, if you ignore his decision and follow your own choice? As the design selected by the assessor is estimated to cost £3,000 less to carry out than that chosen by the committee one is confronted with two possible solutions—either the committee thought themselves better judges of architecture than their professional assessor or there has been some favouritism exercised. What else can be the reason for their action? Could it be that an enlightened opinion uses the assessor simply as a kind of decoy for architects of repute and then makes its own selection from the designs submitted? Even this might be said of some competitions: but it is a gross insult to the assessor and shows a depraved spirit among the promoters. Here we have an ordinary committee over-riding such a competent assessor as Dr. Anderson! Whatever may be the opinion held in regard to architectural competitions in general, it must be conceded that such competitions should, at least, be run on honest lines. But unfortunately it is not always so: if it only were, not half the evil effects would result.

THE POST OFFICE, WITCHAMPTON.

INVERKEITHING.

BY J. JEFFREY WADDELL.

THE "Kingdom of Fife" is peculiarly rich in places of architectural and archæological interest, and among the most noteworthy is the ancient Royal burgh of Inverkeithing. Situated on the shores of the Firth of Forth, this town was formerly one of the principal seaports of Scotland and one of her chief burghs. To-day its greatness has departed; it is now a sleepy old-world town, with an almost unused harbour. But there still remains much to attest its former prosperity that has survived the ravages of time.

In the centre of the town stands the old Market Cross, one of the finest and most ancient of the kind in Scotland, its date being probably 1398. The Cross consists of an octagonal shaft which, rising from a broad base, bears aloft four shields with the Royal and Douglas arms, surmounted by a sundial and unicorn. The base is modern and is protected by an iron railing. Opposite the old Market Cross stands the Town House, with its quaint belfry and outside stair.

DRAWN BY J. JEFFREY WADDELL.

The old village church of St. Peter is worthy of note for its spire and font. The latter, a fine example of Middle-Pointed date, was discovered at the beginning of the past century buried in the lower part of the town. The bowl of the font is hexagonal. Each side bears a shield supported by an angel, and the angles are battlemented and are enriched with corbel heads. The whole rests upon a clustered shaft with foliated cap and moulded base. The tower consists of three stages and terminates in a modern wooden spire. The bell is a good one and is dated 1641. The church itself was burned in 1825, and it is at present being restored by Mr. P. Macgregor Chalmers, of Glasgow.

Besides these public buildings, there are several private dwellings of considerable interest. Queen Margaret's Palace is a plain rough-cast building with crow-stepped gables, which, by the irony of fate, was recently used as a lodging for the navvies employed on the Forth Bridge.

Opposite the church stands the old town house of the Hendersons of Fordel, a fine example of Scottish domestic architecture.

THE PREPARATION OF STUDENTSHIP DRAWINGS.

BY R. WEIR SCHULTZ AND BERESFORD PITE.

AT a meeting of the Architectural Association held on Friday, January 4th, Mr. R. Weir Schultz and Professor Beresford Pite lectured on the subject: "Hints for the Preparation of Studentship Drawings." Mr. Schultz said:—Most of our studentships of the present time are rightly or wrongly awarded on a system by which, under certain conditions, drawings are submitted in competition for the various awards. It is a matter of grave question whether this is the best method of choosing the student who is most worthy to participate in the benefits to be derived from the opportunities for study opening up by the bestowal of the prize. I fancy, however, that it would be going outside the limits of our subject were we to discuss this point; we must, therefore, accept it for the moment as a fact, and try to consider how far the conditions can be acted up to with most benefit to the student and with the prospect of obtaining the best results. During the past thirty years or so architectural students have been encouraged to worship at the shrine of the fetish of mere draughtsmanship, and they have got into the way of dividing themselves into two camps—(1) that of the draughtsman *par excellence*, and (2) that of the so-called practical man. The former have been accustomed to go about with their heads rather high in the air, and a general tone of superiority in their bearing, and to be obtrusively patronising to the latter, who have been looked upon as mere "hewers of wood and drawers of water." It was considered a much greater merit to be able to make

A Pretty Perspective

than to be capable of working out an honest, straightforward piece of construction; and this is hardly to be wondered at, when we find that the bulk of the "plums" were usually awarded, consciously or otherwise, to the most taking set of drawings, looked upon as drawings. Many things were responsible for this, and amongst them I think we may place the following:—1. In the case of the Royal Academy, the fact that the architectural prizes were judged by a committee or council in which painters largely bulked, the majority of whom had little or no knowledge of architecture. We can all remember instances where thorough and careful studies were obviously passed over in favour of others which had been made purposely attractive to the body of selection, often at the expense of ignoring or depressing the essential points of the subject set for study when judged from an architectural standpoint; and, indeed, students got to expect this, and, consequently, drawings were prepared purposely with a certain superficial attraction. I well remember a hue and cry which was raised by students a few years ago when by strange chance a really strong and original, if somewhat unprepossessing design, showing real genius in composition and construction, was given the first place over others better drawn perhaps and worked out on more correct archæological lines, but which did not show anything like the same sturdy grasp and powerful, strong handling of the subject. 2. I think I may also say that Mr. Norman Shaw's beautiful drawings had a potent influence on the younger generation, who seemed to lose sight of his power of composition and daring of construction in the charm of his draughtsmanship. 3. The attraction of the walls of the architectural room at the Academy also carried weight. Men knew that a pretty drawing was more likely to be placed than a clear straightforward architectural diagram. 4. The growth of architectural competition generally likewise created a certain demand for showy drawings, and men knew that they could command a higher price for their services if they cultivated the knack of mere draughtsmanship, and so were apt to ignore the more essential qualities which go to make a good architect.

I assume that we are expected to give you some hints that will be useful to you. There are at least two ways in which such hints can be of service to you; but they may lead in diametrically opposite directions. The first is, hints that will enable you to go in for a studentship with a chance of winning it; the second, hints that may help you to prepare your work in such a manner that you will reap the greatest benefit to yourself from the study of the subject which has been set before you. On the first I cannot venture to help you, and will leave this to my friend Mr. Pite, who, in his day, was fortunate in obtaining some of the most sought-after prizes, and who is now, I believe, a member of one of those mysterious bodies or councils who carry your fate in their hands. On the second, I can, perhaps, give you some advice which may be of use, if only in the way of starting what I hope will be an instructive discussion afterwards. I assume that studentships are looked upon as purely educational, that is to say, affording the young architect an opportunity which would not otherwise be open to him for perfecting himself in the study of his art.

Conditions Which Hamper.

To enable him to obtain one of these studentships certain conditions are laid down, some of which, I am sorry to say, have a considerable savour of red tape about them, and tend to hamper the student rather than to encourage him. I refer more particularly to the condition regarding size and number of sheets, scale of drawings, &c, which are in many cases needlessly arbitrary. Broadly speaking, the type of subject is of two kinds. The student may have to prepare a design for a building or a portion of a building, or he may have to submit a series of drawings, showing evidences of study of old buildings, or their accessories.

The first we may look upon as an essay in design and composition, and it will surely bear on its face the impress of the training through which its author has passed, or show evidences of the course of thought which has influenced him, but whether it will show a grasp of the sense of proportion, a constructive capacity, or an idea of fitness for a suggested purpose is very doubtful. The second will indicate that the author has visited and drawn examples of old work, or perhaps made careful and exact measured drawings to scale of an

old building—church, palace, or mansion; but how far he has peered behind the surface and tried to analyse the motives which influenced the old men, or to grasp the difficulties they had to contend with and see how they overcame them, is quite a matter of small moment as things are at present—probably the idea never occurred to him.

An Essay in Design and Composition.

In the first case, we have a set of taking drawings, a plan more or less apparently workable, the elevations designed in some phase of a past architecture, and all nicely inked in with a good deal of go, carving and figure work perhaps suggestively indicated, but no cohesion, no definite note of character. You look at the perspective view; the building might be suitable for half-a-dozen purposes, it lacks expression.

In the second case you have a series of very pretty drawings with plenty of flick and dash—sketches of church towers, say, or old mansion houses, a piece of panelling or a ceiling to scale, or a church screen or font, and there may be also some sheets of coloured decoration more or less approximately suggesting the present state of the original, with all the blemishes shown to the life; but how seldom anything more! How rare to see the subjects really studied, the materials analysed, the detail and construction investigated!

Draughtsmanship Secondary.

Now in the preparation of studentship drawings it seems to me that draughtsmanship as such should occupy a secondary place. It is not the first essential by any means. The quality of the paper used, the tone of the ink, the breadth of the line, the way in which carving should be indicated, how mouldings should be tinted in: none of these things is of prime importance; undue attention to them will not make you a better architect. What you want to be able to do is to show as clearly as you can that you have made a thorough study of your subject. If it is a design for a new building, get your plan simple and straightforward; if an awkward site is purposely given, fit in your building skilfully and directly. Do not sacrifice everything to a hobby or a piece of empty cleverness. Get a sense of proportion and of dignity, or homeliness as the case may be, or both combined, into your composition. Ignore striving after effect as such. Make it apparent that you have considered the most suitable materials to be employed and the most judicious use of them. Do not neglect your construction. Do not overlard your design with ornament everywhere; if you want sumptuousness, you can get it by concentration more effectively than by diffusion. If it is a building for a town site, do not neglect such practical points as lighting. Do not put heavy cornices or other projections in positions where they will obstruct light and air, or where they will not be visible. Do not place your sculpture where it could only be seen at an angle of 60 degs. or not seen at all. Avoid unnecessary projections that would in reality only catch and hold dust and dirt, to be blown into the windows whenever occasion offers. Do not propose a scheme of colouring that will probably be obliterated after the first six months. Be reticent, appropriate, dignified. Give your attention to these and other such points, and

Do not be Afraid.

There will be plenty of scope left for a building with character, expression, and individuality; and see that your drawings express the building and its nature, just as the building itself should express its uses. Let them be clear, straightforward, and simple. If a perspective is required, let it not be set out from an impossible point of view. Apply the same rules generally to whatever the subject may be. Leave the books alone. There are far too many books to refer to nowadays. Sit down and let your mind have free play, and think the subject out from the beginning. By doing so you are training yourself for the real work of the future, and for tackling the real buildings you all hope to erect. There will be much harder and more complex problems to face then, but you will be able to deal with them far better by overcoming the ones of the present, and whether you win your studentship or not, you should come out of the ordeal feeling stronger and more capable by having manfully faced the real issue, by having trod the narrow path and not the broad road. If, on the other hand, you are asked to submit

Studies of Old Work,

go and examine the old buildings thoroughly; try to put yourself in the place of the old men who built them; realise, if you can, the conditions under which they laboured; look how they made the most of the materials to their hand, and see how they overcame their difficulties, and how sometimes they did not, and had to remedy things afterwards; take warning from their weaknesses; admire their general skill and foresight; and learn what is good to be learnt from their experience; but do not think you are going to imitate them, because you cannot if you try. Conditions are entirely different, and what was straightforward and right in the thirteenth century would be more often than not an affectation now; but come away, if you can, imbued with a desire to emulate them by trying in your day and generation to tackle your conditions as they did theirs, and show by the results of your study that you have grasped this. You may not win your prize, but you will have learned more than if you had done nothing but brought back pretty water-colour drawings and notes of useful cribbable detail.

The Dead Styles.

Do not forget that you are young, and being young, you have enthusiasm, which should carry you far and overcome many difficulties. Do not bury it in the slough of past styles—of Italian Renaissance, of Francis I., of Thirteenth Century, of Roman or Byzantine or Periclean Greek. Do not let yourselves be mere draughtsmen, but be men, and acquit yourselves like men, modern men, men of the new century which has just dawned. Yours will be the task to grapple with its complexities and its new problems. Try to make the complexities less complex and the problems more simple. Prepare to tackle them with a stout heart and with determination, foresight, and common sense. Do not mistake the shadow for the substance. Do not be slaves to a past which

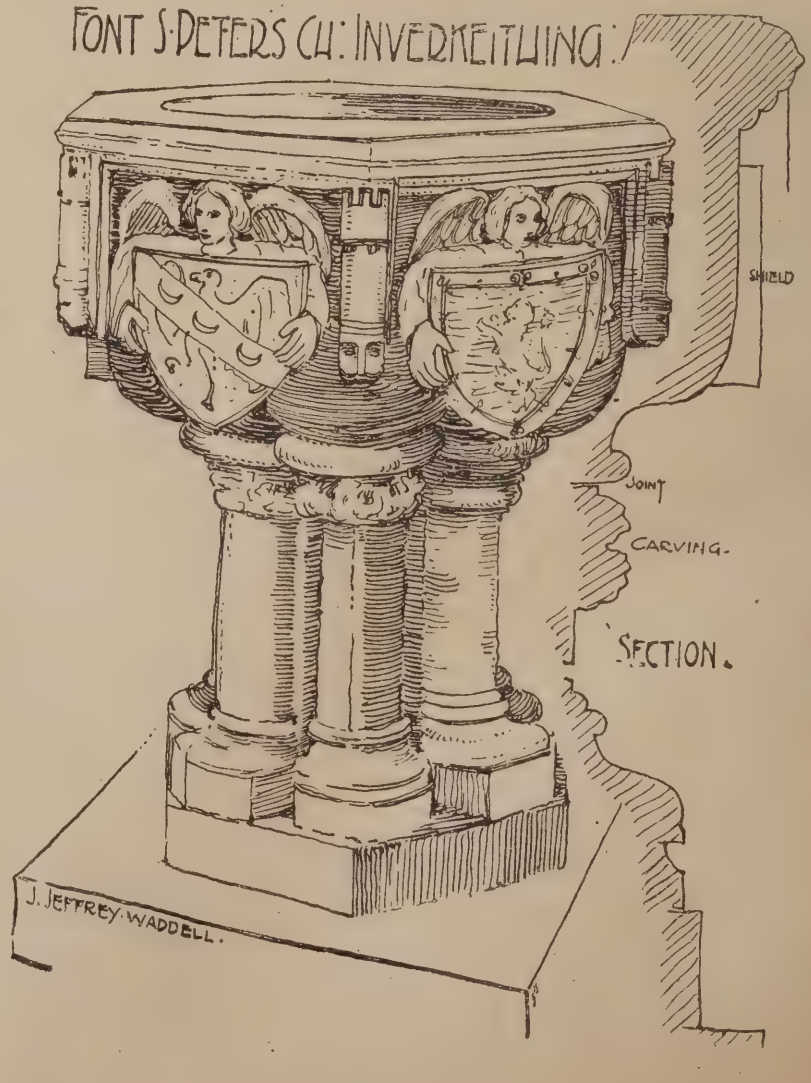
THE TOWN HOUSE, INVERKEITHING. DRAWN BY J. JEFFREY WADDELL.

you probably do not understand. Do not study old buildings exclusively, but look at the works of great modern architects, men like Butterfield or Mr. Philip Webb, who have learnt the useful lessons that the past can teach better than most men, but who can never be classed with the copyists, and whose work can never be labelled with the tag of a dead style. They have worked in the period nearest to you, and have understood and tackled its difficulties. Where they have succeeded there is room for at least a hope that you will not fail.

Professor Pite's Address.

Professor Beresford Pite said Mr. Schultz had put before them the evils of competitions and of draughtsmanship, and had told them practically how not to win a competition. It was certain that if a student were convinced of those evils he would not compete. From Mr. Schultz's point of view, also, a competing student was always working for an impossible end, giving his attention to a real building which would never be built, and working out construction which would never be constructed. If a student held that view he should never dream of going in for a studentship competition. He himself must begin from a humbler standpoint; for, with all its evils, he would very much like still to go in for a competition. He would in the first place give them a few hints about materials. He thought Street's advice was good: to use only the best. Bad paper had an astonishingly bad influence upon a drawing. He would say don't buy cheap paper. A good hard paper should be got. There were many kinds of Whatman's which could be used, and a very good paper was that on which Ordnance Survey maps were printed, known as "Unbleached Arnold," which would stand a good deal of scraping. The O.W. papers were good, especially an extra strong one with a very smooth surface, and there were some good ones known as Joynson's, which would also bear scraping. Unless they would stand scraping the drawing would suffer. The best pencils should be used, such as the 6d. kind, for in pencil drawing fine line was necessary and a good point should always be kept on the pencil. In ruling lines a junction should always be effected where they met, by drawing the lines boldly across and the compass point put upon the junction. The H, HH, or HHH pencils should never be used, for, as architects, they should draw beautifully, and the use of a hard point was about the worst habit possible for the fingers and tended to harden the methods. An HB would probably be found soft enough for small scale, but for details a softer pencil should be used. Mouldings should be drawn with a free and running line, and the best instrument was a brush, which afforded plenty of freedom. Indiarubber was very important. Any artist or architect who was so accomplished that he had not to use the indiarubber must be a very bad designer. He judged a man's artistic conscience by his indiarubber. Rubbing-out was the test of perseverance, the test of revision. The late Prof. Reginald Stewart Poole once said truly that the governing principle of Greek design was elimination; they eliminated and eliminated down to that point of refinement where the work would stand no further elimination. In other words they rubbed out. As to pens, he preferred a soft-pointed pen. The abominable crow-quill mapping pens should be avoided, being as vicious as hard pencils, and calculated to spoil a drawing; at the same time for fine work a fine pen was needed and those known as "Edinburgh Fine Points" were to be recommended. Decent quill pens were difficult to get, but students should not be put off with bad ones for drawing details and bold and free sketching. It was good practice to draw with a pointed stick, for by that means breadth and firmness of line were got. With regard to bottle-ink and stick ink, the former was a doubtful blessing; it was perfectly black, it was true, but under india-rubber, or even hard bread-crumbing, it lost its sharpness and brilliancy. With bottle-ink, too, one had always to draw with the same dead black, and stick ink seemed to bite less into the paper. An ink was needed which could be erased, and he thought stick ink erased more easily than bottle ink. For erasing ink the hardest and best eraser should be used; 6d. at least should be paid for a piece, say of Faber's make. Attempts to wash or scratch out ink lines generally failed. Then as to mounting drawings, mistakes were fatal. They should not experiment with the drawings but have them mounted by a picture-framer. Cheap strainers should not be used; they should be stout, for, if they were not, the strainers are likely to buckle up owing to the drying of the paste. They should have an eye to marginal lines; often drawings were spoilt by a horrible blue or a too dark brown. For a black-and-white drawing there was nothing safer than a white margin. He did not think they were allowed enough freedom in the size of strainers, but that was chiefly on account of want of room. As to the writing on the drawings architectural printing revealed character as much as handwriting—perhaps more accurately. A pompous fellow, full of eccentricities, would be almost sure to show it in his architectural printing. Writing on drawings should be well and plainly done, though they should not imitate printers' types.

Drawings in Black and White.



If the Association was in the habit of passing resolutions, he thought that one addressed to promoters of studentship competitions to the effect that drawings need not necessarily be finished in black and white would be a healthy one. This black covered a multitude of sins: it was inimical to effects, and led to carelessness in drawings. Windows, for instance, were made black instead of inlets for light. He did not know why the use of black had grown to be a necessity in such competitions, but he supposed the promoters were afraid of being bamboozled by colour. There was really a fine scope for the careful use of colour in the getting-up of an architect's set of drawings, and the whole paper technique of their art ought to be artistic and satisfactory. In default of colour he would sooner have a whole set of drawings in outline, which would lead to the cultivation of boldness and quality of line. There was nothing more deceptive than to make a set of drawings and then black them in, for the black destroyed a fine line altogether. Window black was especially mischievous; vertical lining was better. He avoided free etching or sketching on a geometrical drawing, and he thought the shadow tinting which was sometimes seen in deficient elevations was a mistake, as it took the attention off the elevation and its proportions.

Sketches.

In students' designs sketchiness was not permissible or possible, for, as in painting and other forms of drawing, the line of demarcation between sketching and finished work was very definite indeed. The Royal Academy did not exhibit sketches, insisting that every picture should have a finished background, and just the same distinction applied in architectural drawings. A sketch had a charm and freshness which, though attractive, was manifestly different from the finished study. Complete perfection of the accomplished geometrical drawing should be aimed at, but the two elements of students' drawings should not be mixed up. Tiles, &c., should not be raggedly sketched in on to a carefully outlined drawing. He did not see why they should not scientifically put in the projection of shadows, and any student able to do that successfully would have a good pull over those who had not acquired the art.

Unreality of Elevations.

Now, in spite of the sinfulness of it he must say there was a charm and a pleasure in accurate draughtsmanship—in sitting down and trying to excel in it; in trying to draw the dentils and brackets of a cornice, for instance, in such a way as to watch the growing effect; and gradually bringing in detail and letting the building gradually grow up. Attention should be given to the effect of lines, in inking in lines in elevations, but, unfortunately, this was seldom done. In treating ornament, they should give attention to the concentration and grouping

of those lines which made the drawing effective. They could not be too much concerned with the actual lines which told in an actual building, but they should always bear in mind the very important truth that a building never looked as it was seen in elevation on paper. When they were dealing with elevations they were dealing with diagram. There was a definite, logical difference between the elevation—namely, between what the building was and what the building appeared to be; there was no real relation between the two apparent to the eye. A great deal of interest could be given to a drawing if the indication of surface and material were studied carefully. They would realise that drawing horizontal lines 3in. apart all over the building made it look like brickwork; drawing them a foot apart, like stone; and omitting them altogether, like stucco. He had seen beautiful drawings in ink with the brick-course lines put in in pencil and the stone joints in their order, not to confuse the construction lines. But these methods should be used only so far as they gave a conventional effect akin with the materials of the surface.

Plans could be made impressive by the simple aid of dots, and a crooked plan could be made to look quite important by the art of dotting. Pavements and ceilings, fully shown, often made a drawing very interesting, and students must take advantage of these points, especially as they were not asked to show drains and gullies. The interior of a building should be shown in section; it was an opportunity for display which was all studentship drawings were for, and students should make the most of their opportunities. He would advise students to take full advantage of the size of strainer, and make the size of the strainer the ultimate size of the building.

In the detailed drawings, which were usually wanted, a rare opportunity was afforded. The promoters of the competition knew pretty well the sort of thing they wanted in the elevations, but their minds were blanks as to the detail, and they directed that some part of the elevation must be drawn to a larger scale. That was the student's opportunity for display. He should show his freehand and indulge his humour in sculpture, and generally show what sort of a man he was. They should draw boldly, and should make up their mind that their detail should not be overcome by a neighbouring perspective, or by the plan in black above or below. In detail there was an opportunity for using with plenty of freedom the pointed stick. Mr. Schultz had advised them to take the perspective from a possible point of view. He (the speaker) said, do the opposite, and for this reason: the building would never be built, and students should be absolutely unfettered. They should be as original in the matter as they could, and if there were any choice, be imaginative—taking an imaginary standpoint rather than an actual one. They should say to themselves: "This is to be a picture, not a perspective; this is the end of my design; this is all I have been working for; I have come to the point when I can enjoy myself in laying out the richness of my imagination, spreading it large upon the strainer." The building would never get nearer actuality than that; therefore they should make the most of their opportunity. Of course, the perspective would fail badly if it had no relation to the design, and they must work the thing out so as to give it its value.

With regard to

Coloured Perspectives,

they had got into disrepute owing to the weakness of competition assessors. He suggested that whenever they had the opportunity they should master the art of colouring architectural perspective drawings. As to pen-and-ink work the greatest duffer with the brush or the most nervous architectural artist was safe in an outline diagram, which was possible to those who were nothing more than geometrical draughtsmen, and could be made quite interesting and beautiful. Of course if they liked to go further and shade it in in pen-and-ink they would be going outside the bounds of diagram drawing, and would need someone to guide them. He would suggest for the study of pen-and-ink work the study of etching or the works of etchers. The tendency in all pen-and-ink work was to get black spots and darkness without composition or line effect. Then as to

Measured Drawings,

that was different work altogether. If the drawings were to $\frac{1}{8}$th scale, the plan should be done first, and then the line of heights to the scale of the plan. Beginning at the top and working downwards the mouldings should be made full size and not touched afterwards. A few leading dimensions should be taken on the spot, and the building drawn to scale and the mouldings filled in at home from the full-sized drawings. The plot-

DRAWN BY J. JEFFREY WADDELL.

scale sketches ought not to be touched again, for the redrawing of them robbed them of all their life, and studentships which were given for measured drawings not done on the spot were worthless. In measured work everything that Mr. Schultz had said about construction was essential. The student was not designing, but recording accomplished fact, and unless he studied that thoroughly he would not do himself any good. They had to learn to think backwards—to begin with the finished building and go back to the elements out of which it was produced; consequently, they should measure the joints and show nothing which had not been measured. They should not, for instance, take the drawing home and proceed to tack on the stonework. If they wanted to show the rubble, they should measure it. That seemed a hard task, but they might measure, say, 3ft. of it very carefully. This was an invaluable study and equally necessary for both beginners and advanced students, who ought to sketch and measure with thoroughness to the end of their studying days.

As to pencil sketches, they could be done for their own sake—or for the ladies'—and students should enjoy such work in doing so. Such sketches had their work to do, as had other pretty things in this world; but such work should not be confounded with the steady, businesslike drawings which were useful to an architect. Mr. Schultz had given good advice as to

Colour Decoration.

It was very difficult to judge colour decoration from sketches or drawings, and he was inclined to think that drawings of colour decoration were of doubtful value. The colour deceived one, and it was difficult to translate on paper the actual colour of the building itself. One was liable to be greatly deceived, though of course it was necessary to take note of arrangements in the design. For the purpose of studying colour they should go to flowers, the old masters, and ceramics. One rarely got good colour out of old buildings, for the mediæval builders avoided harmony and indulged in positive contrast: whatever harmony in colour there was in old architectural works was the result of time—a refining fog which made old buildings beautiful. Still, it must not be forgotten that the original colour was often crude, or extreme. With regard to design, happy indeed were students. They were happier than their employers, happier than practising architects. They had no clients to worry them,

every opportunity to design, no fads but their own, and these they always enjoyed. Oh! the joy of being able to design just for the sake of designing—to do it because it was nice, and not for the sake of a living. That was the delight and pleasure of a student's life. His advice to them in matters of design was to begin early. The Institute, for instance, published their conditions of competition in March, and the designs had to go in by Christmas. Students could do no great work if they did nothing in the matter until the summer was over. They should begin at once to work up examples. But as they collected examples they must design. When the student had found his material he should work upon it. The student must feed his imagination and cultivate it, and fill his mind with information; he should take up a period or style, and work at it until he got to the bottom for the sake of understanding it. It was open to them to design in the style chosen—not as the ignorant architect did, but as the Academy student was taught to do. The student should cultivate his mind by the study of Bramante, Inigo Jones, or Sir William Chambers, for instance—how they drew and thought, and what detail they loved. In doing that the student would begin to draw, think, and love as did those masters, and a new world would be opened to the student—namely, the world of antiquity. It was not open to the modern architect, but it was open to the student.

Unreal Building.

The student should avoid the commonplace and the conventional, and be academic, grand, and graceful He should remember that it was an unreal building that he was engaged on, and yet he must make it real with architectural life. Whatever the student did, he should not trouble himself in the least about the assessors. All successful students were not successful architects, though, of course, there were some who were. The word "student" had a relation to its end which was study. They must bear in mind that they were not studying to gain the prize or the medal; they were artists studying art for the sake of art, and as such were willing, under these conditions, to compete with others. They were servants of the art, and would continue to be so whether they got the prize or not. Competing for the prize was an opportunity for opening up and revealing the resources of an art which wonderfully exhibited the nature and aspirations of man. The greatness of architecture would possibly never appear so vast as when they took up design, as students for design's sake—for the sake of proving its delights and pleasures. If, when they saw something beautiful, they stored the impression in their minds, some day it would influence them in their design, for the idea would mature in their brain. That was a process that was necessary to any lofty view of architectural art—to progress, really, in architectural art. His advice to them was to get the imagination to operate on the last step in architecture; to try and do something better than had been done before.

THE DISCUSSION.

Mr. H. L. Florence in proposing a vote of thanks said nothing had been said about tracing paper. He always found tracing paper as useful as india-rubber, and it had the extra advantage of preserving first and subsequent ideas. With reference to the use of the brush, it would be a great advantage to the student to take a plain piece of paper and shade it with the brush from black at the top to white at the bottom. It was difficult to do; but when they learnt how, it was of much use later on in getting a disposition of light and colour.

Mr. W. J. N. Millard, who seconded the vote, said architectural drawing was merely the production of diagrams. Unfortunately a great deal of architectural drawing or draughtsmanship ought only to be called penmanship, for it was playing about with a pen on paper and the worship of dots and dashes. He would not call it draughtsmanship, and it certainly was not architecture.

Mr. F. G. F. Hooper and Mr. Arnold Mitchell having spoken, Mr. W. H. Seth-Smith said the judging committee valued the power of imagination displayed, and at the same time they looked upon a design as a study by one who was preparing for practical architecture, and they studied the plan and noted what mastery a student had of building construction. These two points of view he held to be essential.

The vote of thanks having been carried, Mr. Schultz, in reply, said that, in spite of what Mr. Pite had said, he was not converted; nor did he think there was any need of being so seeing that he had advised them to ignore assessors and do exactly what they pleased in their student designs and not to compete for the mere sake of winning the prize, for these were the ideas he himself had tried to express. As to the idea that students should design in a style he supposed they might do that in the same way that boys at school wrote Latin verse. It was easy to learn to design in a particular style, but somehow the tendency was for them not to get beyond it. If they once made their architectural compositions in an archæological manner the inclination was to go on doing so; whereas if they began at the root of architectural design, and studied materials and proportion, they would do something which would be worth looking at. As to the drawing materials he did not think it mattered in the slightest whether they used dark ink or light ink or thick lines or thin; whether the drawing was mounted on brown or on white paper or no paper at all; all that did not affect the result and was not considered at all. When the study of a subject was begun of course it was necessary to look up examples and find out how, for instance, such buildings as town halls or hospitals should be arranged; but even here it would be best to get such information from the practical side and not from books. After the information was obtained the student should begin at the beginning and think the matter out afresh.

Professor Pite, in his reply, said he was for actuality and not the sham and the fraud. Mr. Schultz wanted the student to study materials, but he had not seen that these were ink and paper, &c. If a man would be real he had to work with such things and send in drawings only if he went in for studentship competitions.

Views and Reviews.

Responsibilities of Architects and Builders.

FROM the variety of interests frequently affected by building enterprise, the relative positions of architect and builder are frequently so beset with difficulties that we can have nothing but cordial welcome for a work like the one under review, which is designed to save the unwary from many a pitfall. Mr. Roscoe's well-known "Digest," now in its fourth edition, is, as may be gathered from the author's preface, intended to be useful not only to lawyers but also to those engaged professionally in building transactions. It may be confidently stated that the greater portion of the book is calculated to interest the latter class, the Precedents of Pleading, which occupy about 8 per cent. of the whole, forming about the only part which appeals exclusively to the man of law.

The plan of the work is probably known to many of our readers from earlier editions of it. First we have a collection of digested cases, the subject-headings being arranged in alphabetical order, in the usual way, full reports of some especially interesting cases being added in an appendix. Other appendices are respectively devoted to professional charges, forms of building contract, &c., agreements and leases, and precedents of pleading. There are a concise index and a table of cases.

It is interesting to note the effect of some of the most recent legal decisions in defining the position of the architect both in relation to his employer and the builder engaged in executing the work. Thus, for example, the decision in *Whipham* v. *Everitt* went far to authorise the scale of professional charges approved by the Royal Institute of British Architects. "These charges," to quote Mr. Roscoe, "are not legally binding in themselves, but they are so strongly evidence of reasonableness, that for practical purposes they have the force of law. They form the only rate of payment in regard to which an architect can feel sure of his legal position, unless he has, before beginning any work, agreed with his employer as to the rate or amount of his remuneration." As regards the architect's responsibility for certificates, his position appeared until lately to be somewhat anomalous. As arbitrator between building-owner and builder, he could not be held liable for negligence in issuing an incorrect certificate, but as agent to the building owner he could. This was the effect of the decision in *Rogers* v. *James*. In *Chambers* v. *Goldthorpe*, however, tried in the early part of last year, the decision, writes Mr. Roscoe, comes to this—"that the architect, in regard to the giving of certificates, never loses his judicial character; it protects him throughout; that is to say, he is under no liability whatever to the building owner. For certain purposes he has judicial functions—the parties agree to his decision, they are prepared to abide by it as between themselves. Under these circumstances the building-owner cannot turn round and claim damages against the architect, in his capacity of agent, for what he has done in his capacity of arbitrator." The same principle was upheld in the recent case of *Restell* v. *Nye*, in which it was also decided that the architect could receive 2½ per cent. from the builder out of the contract sum for supplying bills of quantities even when he had agreed with the building-owner that the usual charge of 5 per cent. was to be an inclusive charge for performing the ordinary duties of an architect.

The builder is bound to pay the surveyor for supplying bills of quantities, if he is under agreement to pay him out of the first instalment which he is to receive from the employer, even if the builder abandons the work, and so never receives the first instalment. This was the effect of the decision in *McConnell* v. *Kilgallen*, and the principle was endorsed in *Mellor* v. *Britton*, as recently as last June.

It will be seen from some of the above references that Mr. Roscoe's work has been brought well up to date, and though, as he states, he has not increased its size in the present edition, he seems to have excluded nothing which should have been retained. G. H. B.

"A Digest of Cases Relating to the Construction of Buildings." By Edward Stanley Roscoe, Barrister-at-Law. (London: William Clowes and Sons, Limited. Price 6s.)

Masters and Men.

Proposed Reduction of Wages at Gloucester.—The Association of Master Builders for Gloucester and District have given bricklayers and carpenters and joiners notice of a reduction of a halfpenny per hour in their wages, to take effect from June 24th next. This step has been taken in consequence of the quiet state of the building trade in this neighbourhood, chiefly occasioned through the high prices of building materials and rate of wages. Bricklayers' labourers have recently asked for an advance of a halfpenny per hour in their wages, and have been refused for the same reasons.

The Joiners' Lock-out in the Blackpool District is having a paralysing effect upon the building trade. The building of two board schools and two Congregational churches, representing an expenditure of £50,000, is at a standstill through the strike. There is, however, a disposition to reconciliation. Letters have been addressed to both the committees of the masters' and workmen's organisations on behalf of persons intimately concerned in building undertakings which have come to a standstill, suggesting the name of Alderman Heap as arbitrator or mediator. Replies have been received from both sides accepting the principle, but not binding as to the personality of the arbitrator. The acceptance of the principle of arbitration is a good step forward.

HOLLOW WALLS WITH IRON TIES.

BY G. S. MITCHELL, F.S.I.

HOLLOW or "cavity" walls should be employed for external work in all situations where damp is likely to be caused by driving rain, the aspect most particularly to be protected in this way being the south-west. Much may be done in mitigation of dampness caused by driving rain by training creepers and ivy on the walls, or by planting quick-growing shrubs and trees to afford shelter In this connection perhaps the most useful tree to plant is the Austrian pine, as its rapid growth and compact habit soon cause it to form a good barrier to the wind. Thuja lobii is also a good guard and may be planted when of rather large size, but it is apt to be injured by frost and is not in any case very long-lived.

Cavity walls are particularly needed in the south of England, where the use of porous clamp-burnt bricks is so general. The writer has seen water from driving rain streaming down the inside of a 4½in. wall built of these bricks when the wind-pressure prevented it running down the outside.

Hollow walls may be of brick or stone with a cavity of from 2in. to 2½in. in width, and though the special wall-ties of stoneware or purpose-made bricks are good and clean in work, it is more usual to employ cast-iron or wrought-iron ties, of various patterns, spaced at about 36in. horizontally and 12in. vertically —wrought-iron ties are preferable to cast-iron as they are less liable to fracture should a slight settlement occur in the wall.

Speaking generally, the principle of construction of hollow walls is that the water penetrating the outer casing of the wall shall either run down the inner face of the exterior skin or drop off the ties to the bottom of the cavity. To effect this, care must be taken that neither by the construction nor by the form of the tie shall a bridge be made from the external to the internal half of the wall. Both halves of the wall should be founded equally, and for this purpose it is desirable that their footings should be common to both.

To ensure success it is necessary :—

1. That the ties should either have a V drip in the centre or be double twisted, as shown in Fig. 1, which latter is the author's favourite form of wrought-iron wall-tie. About 230 of these ties weigh 1 cwt. and cost sixteen shillings.

2. That the outer skin should never be allowed to get even fractionally higher than the interior skin, or the ties will have an inclination inwards and disaster is bound to result.

3. That no mortar should lodge on the ties during construction ; should mortar so falling remain upon the ties it will nullify the drip of the tie and will draw damp across to the inner casing by capillary attraction.

To obviate the chance of this, laths or hay-bands should be employed and drawn up as the work proceeds, and, if it should happen that mortar has accidentally lodged on any uncovered tie, a long lath should be inserted to poke it off before the building gets too far advanced. Otherwise it may very probably become necessary to cut the wall (from the inside of the building, for the sake of appearance) at that place ; whenever a roundish damp spot appears on the plaster of such a wall it is conclusive evidence either that a tie at that spot is not clean or that it has not been built fairly in the centre of the cavity and so loses the effect of its twisted form.

A very usual method of forming a hollow wall is that shown in Fig. 2, though such flimsy construction is not to be recommended for first-class work. It consists of two thicknesses of 4½in. brickwork with a cavity of 2in. in width, so that the total thickness is 11in. Such a wall is of less strength than one of solid 9in. work would be and the security it gives against damp is only obtained at the cost of its stability.

A much sounder building is obtained by the use of a 9in. interior casing with a 4½in. outer one, the timbers necessary for roofs and floors resting on the thicker and more stable portion of the wall. When, however, flint or stone is used the thicker skin will in all probability form the exterior portion.

Fig. 2 shows the method of construction which should be adopted for carrying the lower floor joists where two 4½in. thicknesses are employed. The damp-course should be divided as shown in order that any mortar droppings may fall into the cavity *below the damp-courses*, as it will be at once realised that, were the damp-course placed upon the solid work 3in. lower, a bridge for the water would be formed, even if no droppings were present.

The external half of the wall should have air-bricks at top and bottom in order that ventilation may take place in the cavities. The draught in walls so constructed is often such that no candle can burn.

Door and Window Openings.

That no wet may penetrate at the heads of doors and windows strips of lead should be inserted right through the outer wall above the lintel or arch ; this lead should be turned one inch upwards inside the cavity and one inch downwards outside the building, as shown in Fig. 4. The length of the lead strip should be about 2in. greater than that of the opening it covers, so that any drip at the ends may fall clear of the frame. A cheaper but much less efficacious method of dealing with these openings is to form a little cement gutter on the door or window head to fall rapidly each way. Care should be taken to secure that these gutters deliver clear of the frame.

I have occasionally found that rain will penetrate at the sides of a solid window frame even when apparently properly "stopped," and to prevent this I now tack a slight slip of wood about ½in. by ½in. section in a vertical position down the side of the frame and in the centre of the cavity. The haunch at the bottom of the frame must be partially cut away and the slip should go down a trifle below the lower side of the sill ; any rain then driving round the frame will be checked at the stop formed by the wood slip and will run down and drop clear from its lower extremity. This trouble caused by wet travelling round the window frame does not appear to take place where boxed frames are employed but only when they are solid and have therefore no projections on their backs.

Lean-to Roofs.

The same method of laying lead over applies where a lean-to roof comes on to a hollow wall, and a good method of construction for such a lean-to is given in Fig. 3, where it will be seen the plate to which the rafters are secured is carried by corbels from the outer skin of the hollow wall, a strip of 5lb. lead being laid through this wall and turned up 1in. inside the cavity and dressed down at least 3in. over the slates outside (the width of lead strip in the case of a 4½in. wall being thus 8½in.) ; to cover all a projecting weathered and throated string-course of splay bricks laid in cement ensures a water-tight joint.

Wherever a lower range of buildings abuts against the hollow wall of the main block somewhat similar precautions must be taken to prevent the exterior skin of the main wall forming a damp inner wall to the lower building.

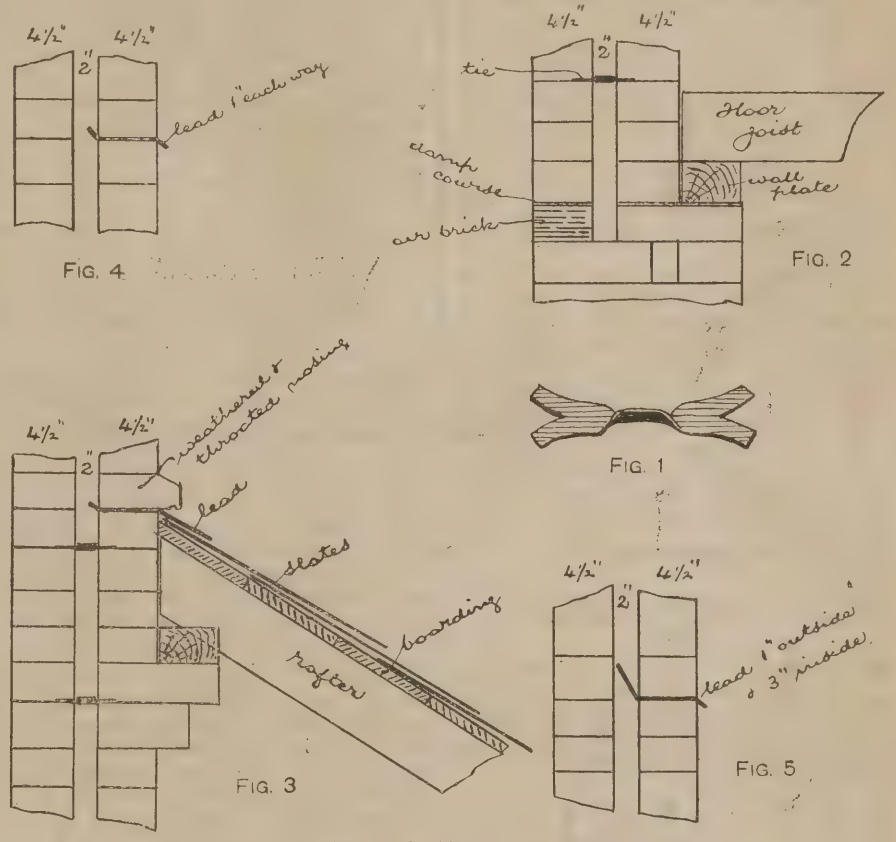


FIG. 4. FIG. 2. FIG. 1. FIG. 3. FIG. 5.

HOLLOW WALLS: DETAILS OF CONSTRUCTION.

Necessary precautions for hollow walls.

The builder of any hollow wall should bear in mind that mortar falls—

a, during the bricklaying.

b, afterwards during the building of the premises.

c, as long as there is any mortar left in the sides of the cavity.

The first-named (*a*) is wet mortar and is dealt with by precautions during the progress of the work as already described.

I have always found it profitable to commence this work by promising the foreman bricklayer a bonus of, say, £1 or £2 if upon completion no trouble is caused by mortar on the ties.

The second (*b*) is dry mortar and is chiefly dislodged during the laying of the floor boards. This is raked out from the bottom of the cavity just before the completion of the building, holes being left for this purpose at the ends of the cavities and at every change of their direction.

The third (*c*) should not be sufficient to fill up the 3in. space left at the bottom of the cavity for the special purpose of its reception, but, if it should do so, it must be removed by

cutting away and raking out as in the second case (*b*).

The chief place from which the later mortar falls is the interior face of the mortar joints (not the ties), as from the nature of the work the inner joints cannot be properly struck, and when the weight of the wall above comes upon the mortar it must squeeze out a little; and in the case of the outer casing certainly the effect of wet and frost will be to cause the over-hanging portion to fall to the bottom of the cavity.

In this connection I heard of a case a short time back where, "to make a thoroughly good job," a builder inserted lead over a long lean-to exactly as I have described it, but *turned up 3in. inside the cavity*, as in Fig. 5.

The result naturally was that not only was the extra 2in. width of lead quite wasted, but that actually a whole course of brick had to be cut away in order that its superabundance might be turned close up against the outer wall in the same position as a 1in. strip would have occupied! He had of course laid the lead so that it just missed the inner casing, and the falling mortar could not in this case fall to the bottom, and consequently quickly formed a bridge across where the lead obstruction did not allow it room to pass. A comparison of Figs. 4 and 5 will at once show this.

The author's specification clauses for hollow walls may be of service; they are as follows:—

"Pick bricks used externally for colour and quality.

"The external walls to be built hollow (as shown) with a cavity 2½in. wide, the two 4½in. thicknesses to be tied together with approved double-twist wrought-iron wall-ties dipped in boiling tar.

"Great care to be taken that the ties are not laid with an inclination inwards, and to keep them free from mortar—a lath to be laid on the ties for this purpose and drawn up as the work proceeds—and holes to be left at the foot of the walls to extract any droppings after floor boards have been laid. Provide and lay efficient damp-course of felt—well tarred—in all walls 3in. above ground line at the least. In the case of hollow walls it is to be laid one course above the solid work so as to allow a slight drop of mortar without injury."

Builders' Notes.

Mr. William Callaghan, who was for nearly half a century connected with the building trade of Liverpool, died recently in his 86th year. The deceased was for many years prominently connected with the Master Builders' Association.

The death of Mr. F. T. Wood, of the well-known firm of builders of Messrs. F. and F. J. Wood, of Cleveland Street, Mile End, E., occurred last week in his 58th year. Mr. F. T. Wood was one of the oldest of Mile End men. He was born in the parish, and lived there—as had done his father before him—all his lifetime.

Partnership Dissolved.—The partnership heretofore subsisting between Messrs. Frederick George Hall, Francis Andrew Hall, and George Wallis Hall, carrying on business as builders at No. 336A New Cross Road, S.E., London, under the style or firm of "Hall Brothers," was dissolved as and from the 31st day of December, 1900, by mutual consent. All debts due and owing by the firm will be received and paid by Messrs. Francis Andrew Hall and George Wallis Hall, by whom the business will in future be carried on under the same style or firm as before.

The new Church at Birmingham, the foundation-stone of which was laid recently, is to be built in lieu of the church of St. Peter, Dale End, one of the two churches demolished last year under the Birmingham Churches Act. The other building was Christ Church, New Street, in place of which a new church dedicated to St. Agatha is being erected at Sparkbrook. New St. Peter's is to accommodate 850 persons. The building alone is to cost nearly £13,000, in addition to the sum of £21,000 said to have been paid for the site.

The Hereford and District Master Builders' Association held its fourth annual dinner last week, Mr. Lewis Hodges, President of the Association, in the chair. Mr. Ramsden proposed "The Town and Trade of Hereford." Sanitary-inspector Sidney Protheroe, in response, said he believed the builders in Hereford had been very busy during the year. During the last twelve months, no less than 360 gulley-traps had been put into premises where the others had been defective, and many old buildings had been pulled down. They had been freer from infectious disease than in any previous year. Speaking of the St. Owen's improvement scheme, he should hail with delight the erection of several rows of model dwellings for the poor. Mr. A. J. Corner gave the toast of "The National Association." Mr. A. Krauss, the founder of the federation, in reply, mentioned that the representatives of the four federations had held a meeting to discuss the affiliation of the National Association of Master Plasterers and closer relations with kindred associations. After a lengthy discussion, they arrived at four distinct points on which they would welcome kindred associations:—(1) that we cannot recognise any members except they are affiliated to their local associations; (2) rule 3 to be admitted; (3) no one to be admitted if he is a member of a trades-union; (4) no monetary bond to be required. Mr. W. P. Lewis, sen., in giving the toast of "The Architects and Surveyors of Hereford," stated that he used to be troubled very much about the contract forms, but since the architects had adopted the contract form approved of by the Royal Institute of British Architects and the National Association of Master Builders, things have been much more satisfactory. In this form there was an arbitration clause, which was chiefly what they had been asking for, and also a strike clause. One clause the builders got in their specifications generally was as to the details that were to be provided thereafter. By the new contract form if the builder considered these details to be excessive, and failing agreement about them with the architect, he could refer the matter to an arbitrator. He did not think there was a man who would not say such an arrangement was fair and just. Mr. E. H. Lingen Barker, in reply, said that he thought he was correct in saying the builders of Hereford were bound together as an association for two purposes: defence, not defiance, of their proper position in the building world, and this not only against their workmen, but also against the building public. They combined, then, to get a fair contract, and to put an end to strikes; however, they could not do that, though they could do something towards it. Fortunately they were not face to face with anything of the kind at present. The men were apt to tell them and accuse them most unjustly of taking all the benefit that arose from low wages, but this was not so. Builders put, and very properly put, an extra price on to their contracts, if they had to pay their men more money, and the consequence was the building public hesitated to build. It would be a desirable thing if they could in some way or other enlighten working men, because many of them were misinformed, as to the real state of the matter. If they knew that the fact of asking for higher wages would prevent builders carrying out their contracts, and so employing them, thinking working men would hesitate before they pressed these demands on the masters. He did not quite know how it could be done, though the idea had occurred to him it might be possible to send competent persons to address the workmen on the question, and also by the distribution of printed leaflets, to show that two eightpences were better than one ninepence. He thought that thinking working men would come to the conclusion it was. If the men were persuaded it was not to their ultimate advantage in many cases, there would be far less agitation, and both architects and builders would find more works would be carried out than at present, as one of the reasons why business was not more brisk was on account of the fact he had mentioned.

Quarry Notes.

A Putty for Repairing Broken Stone is made by reducing the following ingredients to powder. Mix all together in a mortar, and make into a thick putty with water just before use. Ten parts of clay, four parts of fine iron filings, two parts of peroxide of manganese, one part of common salt (sodium chloride), and one part of borax. The heat will harden this cement. A cement for a similar purpose that will resist a very high temperature is prepared by making into a paste with solution of silicate of potash and borax one part of sulphate of barium and two parts of clay.

The death of Mr. James Haddon Bower, of Pitmurchie, occurred last week at the age of 70 years. Mr. Bower was one of the prominent granite merchants of the city, being leading partner of the old-established firm of Messrs. Bower and Florence, granite merchants and quarry owners, Spital Granite Works, King's Crescent, Aberdeen. He retired from active participation in the affairs of the firm some time ago, his place being taken by his eldest son, Mr. Haddon Anderson Bower, who had been for some time associated with his father in the business. During his time many important works have been carried out by the firm.

Slate-making at Angers, France.—At the slate quarries of Angers, France, roofing slates have to be dressed on the spot before the slate has time to dry and lose its fissility. The block is first divided with a chisel into thick slabs, the size of a slate. Then the splitter seated under a wind-screen, places the piece of schist between his legs, and with a very thin chisel and mallet strikes on the edge to detach the plates. It now only remains to give the plate its form and dimensions, which is done by the aid of a very heavy iron knife, the end of which is run through a ring, and falls down on the edge of a block. A skilled workman can make 700 to 800 slates per day, but the more the dimensions of the slate are augmented to compete with machine-made tiles, the more delicate the work becomes, and is a source of frequent disputes between masters and men.

A Hull Firm of Slate Merchants.—A change of style in a Hull firm, which since the year 1789 has undergone no alteration until now, is announced. This is the firm of "William Dawber and Son," slate importers and building material merchants. With the advent of the present century this firm changed its style to Dawber, Townsley and Co., Limited. It must have been even prior to the remote date of 1789 that the firm came into existence, for on the assurance of the late Mr. W. C. Dawber the firm's bank book for that year was in his possession. In connection with the building trade master slaters have been the pioneers in many a forward step, and have done much to build up the Welsh slate trade upon its present basis of popularity. The firm of W. Dawber and Son was not behind in this respect, for in pre-railway times, and during the early days of railway extension, it was no unusual thing to find several coasting vessels at the firm's wharves at Hull discharging freights into small barges to be conveyed by river or canal to inland towns—Goole, Leeds, York, &c. Operative slaters were sent out to fix these slates, and such were the conditions in those early days that the slaters went from job to job, only returning home once in, say, eight to twelve weeks, and in some instances considerably longer periods. To Hull belongs some little credit for the development of the slate trade on the Continent, for Messrs. Dawber sent the first cargo of slates ever imported into Hamburg. Of the firm Mr. William Dawber was the founder, and at his death, in 1829, he was succeeded by his son Robert, who continued business till early in the seventies. The late William C. Dawber then became the sole proprietor, and it was at this time that Mr. Townsley entered the firm, and subsequently became a partner. On the retirement of Mr. W. C. Dawber the business was converted into a private limited liability company, and has now undergone a change of style.

SMALL HOUSES FOR THE WORKING CLASSES.

IN the course of a lecture on "The Housing of the Working Classes," delivered last Thursday before the Sheffield Society of Architects and Surveyors, Mr. H. Potter, A.R.I.B.A, said that he did not intend to discuss the social or political side of the question, but to touch on the difficulties with which architects had to contend, to recognise the natural requirements made by owners as well as tenants, and to see how they could best serve the interests of both. In providing dwellings for the working classes, one of two methods was generally adopted, either to build blocks of four or five-storeyed tenement buildings in the centre of a town, or to erect cottages in suburban districts to accommodate one family only, or at any rate not more than two. He proposed to limit his paper to the consideration of the latter class, namely, small houses to be built either semi-detached, in blocks of four, six, or eight, or even in larger terraces. In a locality with a large working-class population earning good wages there must be a steady demand for this class of residence, and, owing to the existence of an excellent service of electric trams and cheap fares, Sheffield possessed one of the best aids for solving its own housing problem, for by this means there was easy access to the suburbs, enabling a working man to live where he and his family could enjoy a house and a reasonable space of ground to themselves, pure air, and be within easy reach of the country, instead of in a suite of rooms in a lofty tenement building situated in the centre of the city. But there were probably here, as in most towns, a certain number of men who, owing to the nature of their calling, must live in the heart of the business centre, and for these an excellent scheme is now being carried out by the Corporation in the Crofts area. There were many difficulties to be contended with by architects in designing these houses, which were all due to the important considerations of cost or the rent the occupiers can afford to pay, this being influenced by (1) the frequently high price of land; (2) the increased cost of labour and materials; (3) the adoption of more stringent building regulations by authorities. In reference to the last, no objection could be raised to by-laws that tended to check unsound and unsanitary buildings, but architects did feel at times that they added unnecessarily to the cost. In this respect Sheffield enjoyed privileges in two important instances, namely, it was permitted to have two storeys and rooms in the roof with a 9in. external and party wall, and it was not necessary to carry the party walls through the roof for a height of 15in. After giving some instances, the lecturer briefly referred to some points that arose in laying out estates. He suggested that instead of large owners and public bodies cutting up the land at the rear of the houses into small strips for so-called gardens, each house might have a small yard, and the remaining land be kept as one large open space for the benefit of all the adjoining houses. With sites 70 or 80ft. deep a space 40 to 60ft. wide could be obtained extending the entire length of the houses, which would form an excellent playground for the children, would facilitate the drainage, give good access to the rear of the premises for the delivery of fuel and collection of refuse, and save the loss of frontage caused by providing for this in the ordinary way. After making a few remarks about roads and the length of time these were sometimes allowed to remain in an unfinished state, the lecturer discussed the planning of these small houses in detail. He referred to a series of plans shown in the room illustrating houses occupying frontages of from 12 to 18ft., beginning with four-roomed cottages for one family, and gradually increasing in size up to six and seven rooms. Then followed plans for double tenements, representing a class of house for which there is an increasing demand in industrial centres. They consist of ground and first floors arranged in "flats," each having a separate front entrance, and being self-contained in every respect. They meet the requirements of a large class of people who are unable to pay the rent required for single tenement houses, and avoid all the inconveniences that arise if two families share a house that was originally intended to be occupied by one. In conclusion, the lecturer referred to the external treatment of these houses, and in making a plea for a more careful consideration of this part of the subject showed drawings illustrating the use of different materials in a simple but effective manner.

THE VICTORIA EMBANKMENT.

L.C.C. ELECTRIC-LIGHTING SCHEME.

WE print as plates this week plans and elevations of the new electricity generating station which has been erected by the London County Council on the Victoria Embankment, close to the Charing Cross Station of the District Railway. Portland stone has been used for the exterior, and the high-pitched roof is covered with green Westmorland slates. It may be mentioned that the design (by Mr. W. E. Riley, F.R.I.B.A., Superintending Architect to the Council) was submitted to the Royal Institute of British Architects, who made certain suggestions for improvement. The accommodation provided and general arrangement can be seen by examining the plans. The contractors are Messrs. Holloway Brothers, of Lambeth; Messrs. McClure and Whitfield, of Stockport, supply the dynamos, &c.; the gas engines are contracted for by Messrs. J. E. H. Andrew and Co., of Reddish, near Stockport; and Messrs. MacFarlane, of Glasgow, will supply the lamp standards. The lighting scheme will include the Victoria Embankment (extending from Blackfriars Bridge to Westminster Bridge), Westminster Bridge, and the approaches, so far as they are under the Council's control.

The lamps, each upon standards about 24ft. high, will be 144 in number, and will be of 500 watts. They will be divided into nine circuits, each circuit containing from 15 to 30 lamps in three to six groups, each group containing five lamps in series, the groups in each circuit being parallel. Lamps will be placed upon each side of the Embankment, on the kerb, at a distance of 45yds. apart, alternating on the two sides. On the land side the pavement is 16ft. wide, the roadway is 64ft. and more in width, and the pavement at the river side is 20ft. wide. No change, however, will be made with regard to the existing parapet lamps in which gas is now used, save that a new lantern will replace the old and will be occupied by a small arc light. Some of the trees will no doubt have to be removed in order that the full value of the new illuminant may be obtained. This has already been done, in fact, to some extent. And here it may be observed that such a wide avenue as the Embankment requires far more than the ordinary proportion of light, because, in addition to the trees, there is an absence of all illumination from shop windows, private lamps, &c.

The generating plant will consist of four units, each consisting of engine and dynamo. These units will be similar in all respects, and any three of them will be capable of supplying the whole of the current required, the fourth being kept against any emergency. In addition, there will be a motor generator for supplying the current required for lighting the station, for charging the accumulators, and for driving the motors. The four continuous-current dynamos are each to be capable of giving a current of 70 amperes at an E.M.F. of 550 volts and a maximum output of 40,000 watts, and each will be driven by a gas engine—which will be required to develop a maximum power of 68 B.H.P., the normal working load to be 54 B.H.P. when running at 210 revolutions per minute. The gas engines are to be on the "Otto" principle. The scheme has been prepared by the Council's chief engineer, Sir Alexander Binnie, and is being carried out under the immediate supervision of Mr. T. P. Gunyon.

An Isolation Hospital at Shardlow, Derbyshire, is to be erected at a cost of £9,143.

Engineering Notes.

Richmond Electric Tramways.—The Richmond Town Council have decided to oppose the new Electric Tramways Bill so far as it refers to their district.

Bristol Dock Extensions.—Bristol has resolved to proceed with the Bill for the construction of a new dock at Avonmouth for the largest type of vessels at a cost of £1,800,000.

Electric Trams for Chester.—The ratepayers of Chester have, by a poll taken last week, decided in favour of the Corporation's proposal for introducing electric traction on the tram lines.

The New Sanatorium, Malvern, is being warmed and ventilated by means of Shorland's Manchester stoves, patent exhaust roof ventilators and special inlet ventilators, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Dover Harbour Works.—The first stone of the eastern arm of the National Harbour of Refuge at Dover, weighing thirty tons, was laid on Thursday last. It is expected that in fine weather twenty to thirty blocks will be placed in position daily.

The Monte Video Harbour Works.—The Government Commission appointed to examine the tenders for the Monte Video Harbour Works has unanimously decided to recommend the Government to accept that of the French Allard-Coiseau-Dolleus Syndicate. The amount involved is about £2,400,000.

Electric Traction on the Underground.—At a special meeting of the Metropolitan District Railway Company held last week resolutions were passed for the raising of an additional capital of £500,000 and the creation and issue of £166,000 of debenture stock, in order that electric traction might be adopted.

Sunderland Tramways a Success.—The profits from the municipal overhead electric tramways in Sunderland have exceeded expectation. The receipts, which were estimated at 10d. a mile, have been 1s. 6d. a mile, and there is a nett profit of over £3,000. The Corporation has decided to spend £27,000 in extensions.

Hampstead Tubular Railway.—Among those on the committee of Hampstead residents who are opposing this scheme are Sir L. Alma-Tadema, Mr. Asquith, Sir Walter Besant, Mr. G. H. Bibby, F.R.I.B.A., Mr. Basil Champneys, Mr. Alfred East, Dr. Garnett, Miss Octavia Hill, Lord Iveagh, Mr. G. Shaw-Lefevre, Mr. David Murray, Mr. Briton Rivière, and Mr. Norman Shaw.

The Quirinal Tunnel at Rome.—The work of boring a tramway tunnel under the Quirinal Hill, at Rome, is now completed. Boring was begun at both ends of the tunnel, and the two openings were found to coincide perfectly. The total length is 350yds. and the total width 16yds. The work will connect the two busiest quarters of Rome, which centre respectively in the Via Tritone and the Via Nazionale.

Electric Motors for Cartage Purposes.—The Fulham borough surveyor has prepared for the consideration of the Council a special report on the use of electric motors for cartage purposes, in which he opposes their adoption on the ground of expense. In the neighbouring borough of Chelsea three steam motor vans have been in use for about six months, and have proved highly satisfactory both as regards economy and expedition in the parish work.

Sir William Preece on English Engineering.—Sir William Preece controverts the theory that decay in English industry is taking place. Engineers in this country have always been the pioneers, says Sir William. It is a mistake to say that we are behind America. The overhead electric railway at Liverpool is the first overhead electric railway in the world. If anyone wants to know what is best in locomotion work let him go to the London and North Western works at Crewe.

Bricks and Mortar.

APHORISM FOR THE WEEK.

A man may well be an artist though the tools of his craft be not in his possession.—SENECA.

Our Plates. SOME particulars of the new electricity-generating station erected by the London County Council on the Victoria Embankment will be found on page 457 of the present issue.—With regard to the church at South London, Ontario (Burke and Horwood, architects), the position of the site and the finances of the congregation made it necessary to adopt a basement schoolroom. It was also required that the entrance should be roomy and attractive, and that it should light up well at night, as the sides of the building would not be seen to any extent. The large porch permits broad stairs to the auditorium and easy and direct entrance to the basement to be provided.—Brislington is close to Bristol.

Somerset House Extensions. THE statements that have appeared to the effect that Somerset House is to be greatly enlarged are premature, says the "Birmingham Daily Post," for, although every year the need for such an extension becomes more pressing, the Government is not at present prepared to find the money, while a counter scheme is much favoured to transfer some of the work now done at Somerset House to another building. Plans for the proposed extension have been prepared, however, by an enthusiastic official upon his own responsibility. He has designed extensions, east and west, that would double the Strand frontage, and provide 800 new rooms, Sir William Chambers's stately work being closely imitated. "An enlargement of Somerset House, if the step be undertaken, will need to be closely watched, for every canon of artistic taste must not be outraged, as it was a year ago by the construction of a hideous red-brick barrack at the Tower of London, under the architectural auspices of the War Office, spoiling the view of that venerable structure from the Thames."

The Fallen Stones at Stonehenge. CONSIDERABLE correspondence has taken place in regard to the fallen stones at Stonehenge (see page 436 of last week's issue). Mr. Phelps remarks in the "Times" that there originally was an outer circle of uprights with lintels on top, fitted together not only with mortise and tenon on the upright, but also with notches on the centre of each lintel, one projecting, the other indented on opposite end. The lintel has fallen between the two uprights and their impost and is broken across, but the fallen upright is scarcely damaged, and could, Mr. Phelps thinks, be easily replaced. He hopes a scientific investigation will be undertaken as to the composition of the stones—whether natural stones or concrete, as some have maintained. "Surely," says another correspondent, "the time has come when the nation should take charge of this ancient monument:—(1) Under proper supervision, the three trilithons which came down in 1797 could easily be replaced, as well as the one just fallen, as careful drawings of them are preserved *in situ*; (2) then some judicious surface draining would save the remaining trilithons from being gradually undermined by every passing shower; (3) the circular vallum or ditch might be restored by deepening, so as to be a real fence to the temple." Another correspondent has an ingenious scheme for preserving the stones. He says:—"For about a foot along one side of a stone let the earth be cleared away to a depth, say, level with the bottom of the stone, and to a distance outwards of 6ft. A trench would thus be formed extending outwards from the stone and having a length of 6ft., a breadth of 1ft., and a depth of about 5ft. This trench is then filled with concrete to about 6in. from the top. Now form a similar trench on the opposite side of the stone and fill this with concrete also. A third trench would then be cut alongside the first—the concrete in which is now hard—and this third trench in turn is filled with concrete. A fourth trench could then be cut alongside the second and the operation repeated until the stone is embedded in and firmly attached to a solid mass of concrete. Of course cement or any other suitable material could be employed instead of concrete. By this method no considerable part of the stone is left unsupported at any time, and there is no risk of displacement during the progress of the work. The turf would then be replaced upon the concrete." Yet another correspondent calmly proposes that the fallen stone should "be joined up with iron clamps, let in and covered with cement to prevent corrosion." "Every practical man of experience knows, or should know," says Mr. Harry Hems, "that whenever iron clamps, in any form (galvanised or otherwise), are used in conjunction with masonry, ancient or modern, the stones themselves, sooner or later, are doomed. Had he suggested clamps—if any—of copper or bronze, the idea might, possibly, be open to serious consideration; but iron ones simply spell deliberate destruction."

Lift Accidents. THE Board of Trade report upon the accident that occured in June last to one of the lifts at the London Bridge Station of the City and South London Railway is instructive. As one of the lifts (in which there were three passengers and the lift man) was about to be lowered from the booking-hall to the level of the platforms, the overhead pulley-shaft of the counterweight broke in two places, causing the weight to fall and the cage of the lift to descend rapidly on to the buffers at the bottom of the well. Owing to the descent of the cage being in this way suddenly arrested, some heavy weights, which had been placed on the top of the cage, apparently for the purpose of adjusting the balance between the cage and the counterweight, became displaced from the girders on which they were resting, and broke through the roof of the cage, falling upon the persons inside. The results were very serious. The lift man and one passenger had their left legs broken, while another passenger sustained a bad fracture of the jaw. The third passenger was not struck by the weights and escaped all physical injury. The safety-gear consists of four cams actuated by springs which are released as soon as any one of the ropes supporting the cage breaks or becomes slack. In this case, as no rope broke, and as the friction of the ropes on the drums caused a constant strain to be maintained on them and so kept them tight, the springs would not have been released and the cams would not have come into play, even if the safety-gear had been available. To remedy this defect in the safety-gear it is proposed to add a rope passing direct from the clutches over the pulley at the top to the counterweight. Any alteration then in the distance between the cage and weight, measured along the course followed by this subsidiary rope, will at once cause the clutches to come into operation. As probably the majority of lifts in use in this country are fitted with safety-gear of a description similar to that described, it is desirable that steps should be taken in all such cases to guard against the defect referred to.

The Third Admiralty Block. AS stated in our last issue, Messrs. Leeming and Leeming are at present engaged on the plans for the third block of Admiralty buildings in Whitehall. When this enterprise was begun the necessity for this third block was not foreseen, and the intention was to carry along the north side of the Horse Guards Parade an ornamental screen consisting of a covered passage-way connecting the old buildings with the new. Long before the second block was finished, however, the expansion of the Navy necessitated a corresponding expansion in the Admiralty staff, and it was perceived that this third building would be imperatively necessary. Two years ago £150,000 was voted for the purpose, and that is now going to be expended. The first erection cost £190,000; the second, which is now fully occupied chiefly by the Accountant-General's department, cost £160,000; so that by the time the quadrangle is complete the total expenditure on the new Admiralty will be not less than half a million of money. It is now clearly foreseen that this third extension will not be the completion of the business, and the site for a fourth addition is already under consideration, and by the time the work now to be undertaken has been carried through, and extension number four has been got under weigh, the probability is that it will be found the original Admiralty is hopelessly out of date and out of keeping with the new erections behind it and the imposing pile of the new War Office in front of it, and Mr. Shaw-Lefevre's proposal to rebuild it will no doubt come to the fore again. It is well known that the old building has a very unsatisfactory foundation, consisting of two layers of oak planks laid on what was a sort of swamp, and the levellings taken for the new architecture have revealed the fact that one corner has subsided to the extent of 8in. The forthcoming third block will occupy a very prominent and important position, and it is intended that it shall constitute the front of the whole establishment. It will overlook the Horse Guards Parade, and the general design of it will be more elaborate and imposing than the other façades. It will be richer in ornament, and will be embellished with sculpture. How long it will take to complete cannot now be definitely stated.

An Extensive West-End Improvement. THE Tottenham Court Road estate of the Corporation of London, which comprises about 4½ acres, was one of the properties bequeathed by old John Carpenter, the City's Town Clerk, in 1440. Beyond its historical associations there are literary and social memories connected with the site which are deeply interesting. The leases of the properties are rapidly falling in, and the next ten years will witness a complete change in a large portion of Bloomsbury. It must be remembered that Bloomsbury is a modern suburb, in spite of its literary and artistic associations, and that less than a century ago it was a pastoral domain upon which the lowing herds browsed peacefully enough. A map of 1808 shows Alfred Place with its north crescent in Chenies Street, and its south crescent in Store Street, still unbuilt, though planned out. The architect responsible was George Dance, R.A., who was the clerk of works to the Corporation. Mr. Dance was very partial to crescents. Welby Pugin once resided in Store Street. The bulk of the leases on this estate fall in two years hence, while the later ones end in 1908. The crescents will be abolished in favour of a block form of building, and new streets will be made in conformity with the improvement. Alfred Place will be prolonged northward and southward, on the north to meet Alfred Mews (to be widened to 50ft.), and on the south to meet a new street which will run into Tottenham Court Road, and will also be 50ft. wide. As several properties facing Tottenham Court Road have recently been rebuilt little alteration will be made upon the line of frontage. The plans have been drawn by the City Surveyor (Mr. A. Murrray), under whose direction the important improvement will be carried out.

Carshalton Park. THE charming village of Carshalton, in Surrey, is in the hands of the builder, for the greater part of Carshalton Park is about to be covered with houses, and the fine old brick wall which hid house and trout stream from view is already down. It is to be hoped that the very handsome hammered-iron gates, which possess quite a reputation, will not be lost sight of or allowed to fall to ruin. It is said, indeed, that a possible purchaser has appeared from America; but the gates deserve as happy a fate as befell those of Chiswick House, which were removed not very long ago to Devonshire House, in Piccadilly, where they add a touch of splendour to the ugly brick wall in front of the ducal abode.

ANCIENT LIGHTS.

JOINT REPORT OF R.I.B.A. AND SURVEYORS' INSTITUTION.

THE joint committee of the Royal Institute of British Architects and the Surveyors' Institution appointed to consider the law relating to ancient lights have issued their report. They recommend the following amendments:—

1. The right to ancient lights shall, in all cases where such rights have not been already acquired, be limited to a right to receive light sufficient for all ordinary purposes, but shall not include a right to light of extraordinary amount for special purposes.

2. After the passing of the Act the owner of any tenement not at the time servient to some neighbouring tenement, but over which such neighbouring tenement would in course of time acquire dominant rights, may serve upon the owner of such neighbouring tenement a formal notice, in form and manner prescribed by the Act, and may advertise the same in the daily papers, and register the same at the Land Registry, where one exists, of the district, or, where no such Land Registry exists, at the offices of the county or municipal council of the locality. Such notice shall have the same effect as though an interruption had been submitted to for one year, and such notice shall run with the land.

3. The owner of a building which is about to be taken down may cause plans, sections, and elevations to be prepared, and such drawings if they be attested by the district surveyor in London, or the county or borough surveyor elsewhere, shall be accepted as legal evidence. Such drawings shall on demand be certified and registered by the officers above named, who shall be paid fees on a scale appended to the Act.

4. No building erected after January 1st, 1905, shall acquire any fresh rights of light or air where it abuts on any streets, highway, road, court, or alley used by the public, or as an access to various tenements, either held in the same ownership or in various ownerships.

5. The owner, lessee, or occupier of any tenement, who considers that his ancient lights will be or have been interfered with by the erection or proposed erection of new premises or alterations to old ones, shall have the right to inspect (or have inspected on his behalf) the drawings which shall be prepared by the building owner of the premises which cause such interference; or if no drawings are in existence, to be informed of the intentions of the building-owner, and to take or have taken such particulars from the drawings or information or from the building itself, if erected, as may enable him to ascertain where there is ground for complaint.

6. If such neighbouring owner, lessee, or occupier considers that the lights of his premises will be interfered with, he shall, within seven days from obtaining such information as aforesaid, give notice in writing by registered post of his objection to the building-owner, together with the name and address of a surveyor who shall have power to act on his behalf.

7. Within seven days of the receipt of such notice the building-owner shall acknowledge the said notice, by registered letter, and infom the person from whom he received notice of objection of the name and address of his surveyor, who shall also have power to act on his (the building-owner's) behalf.

8. Such two surveyors so appointed shall, within ten days of the date of the appointment of the last of them, select and appoint an umpire under their hands in writing, such umpire being a member of the Royal Institute of British Architects or of the Surveyors' Institution. The first-named two surveyors shall within the like period meet and discuss the points raised by the owner, lessee, or occupier, with a view of settling the same, and failing coming to a settlement they shall refer the matter to the umpire appointed as aforesaid. The said umpire shall view the site and buildings of both plaintiff and defendant, and shall have power to take such evidence upon oath as he may think necessary, and he shall, within 21 days from the date of the matter being placed before him, or within such extended time as he may from time to time determine, issue his award, in which he shall determine either or all of the following points: the right of the building-owner to carry out his intended works, the alteration (if any) necessary to be made in carrying out the proposed new buildings or alterations to prevent or lessen the obstructions complained of, and the amount (if any) of compensation of every description to be made to the owner, lessee, or occupier, the alterations or improvements to the adjoining premises by light-reflecting surfaces, enlargement of lights, heightening of premises, or other means, the amount of costs to be paid by each or either party, and generally all matters required to arrive at a settlement.

9. In the event of either party neglecting to appoint a surveyor within the time prescribed, or of the unwillingness of the umpire appointed to act, and no other umpire being agreed upon within a further period of ten days, either party shall apply to the president for the time being of the Royal Institute of British Architects, or the president of the Surveyors' Institution, who shall appoint an umpire forthwith, with all the powers as before described.

10. If either party shall be dissatisfied with the decision of the umpire, he may appeal to an Appeal Committee to be formed of nine persons, appointed annually, namely: three architects to be appointed by the Royal Institute of British Architects, three surveyors to be appointed by the Surveyors' Institution, and three barristers to be appointed by the Home Office. Three members, of whom one shall be an architect, one a surveyor, and one a barrister, shall form a quorum. The decision of this committee, save as hereafter mentioned, shall be final, and they shall have full discretion as to costs. Before giving a decision the members sitting on the case shall personally visit the premises of the plaintiff and defendant, and shall have power to decide whether, and if so to what extent, the proposed new buildings shall be amended, or the dominant premises altered.

11. In the event of either party refusing to accept the decision of the committee in all cases in which a larger sum than £500 is awarded either in money, damages, or works, or in which the interference with the proposed works exceeds £500 in value, he shall have power within one month from the publication of the said decision to bring the matter before the High Court of Justice by a summary process. The Court shall have the full powers set out in clause 8 aforesaid.

12. In any action to restrain building on the ground of its interference with the rights of light, and whether an interim injunction has been obtained or not, either party may apply to the judge by summons, either to hear the same with an assessor or assessors, or to refer the same to arbitration in accordance with clauses 8 and 10. If at the hearing of such application or motion for injunction it appears to the judge that the claim may be satisfied by damages, he may himself refer the case to such arbitration, and if he considers that the action for an injunction has been commenced unreasonably or unnecessarily, may order the party bringing such action to pay the defendant's expenses and costs on such scale as he may deem fit.

The committee—which consists of Messrs. T. Roger Smith (chairman), E. A. Gruning, J. Douglass Mathews, J. Fletcher Moulton, Q.C., H. T. Steward, Alexander R. Stenning, H. Chatfeild Clarke and George M. Freeman, Q.C.—further recommend that they be empowered to expend the necessary funds in drafting a public Bill to carry out the above provisions.

The report has been adopted by the Council of the Royal Institute of British Architects, and intimation of such adoption has been conveyed to the Council of the Surveyors' Institution.

A Marble Bust of Richardson, the novelist and printer, is to be presented to the St. Bride's Foundation Institute by Mr. Passmore Edwards. It is being sculptured by Mr. George Frampton, A.R.A.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Stability of Townsend Chimney, Glasgow.

GALWAY.—D. E. S. writes: "While reading a certain work relating to building I observed the following statement: 'The Townsend chimney at Glasgow oscillates to the extent of 3ft., that is to say, 18in. on each side of the vertical.' The chimney is stated to be 454ft. high. I should be glad to learn what stress would be set up in the brickwork at the ground level through the oscillation mentioned."

This is, or was, the tallest chimney in the world. It was designed and built by Mr. Robert Corbett, of Glasgow, in the years 1857–9, and contained 1,300,000 bricks, exclusive of those for the flues. The diameter at the bottom (ground line) is 32ft. and at the top 13ft. 4in. The height from ground line is 454ft., and from bottom of foundations 468ft. From Professor Rankine's report on its stability the weakest point appears to be at 200ft. above ground-level, the greatest safe pressure of wind being estimated by him at 63lbs. per sq. ft. For full particulars of this and other tall chimney shafts see Bancroft's "Tall Chimney Construction" (Calvert, Manchester). The total weight above ground line is about 6 500 tons. The thickness at bottom is 5ft. 7in. The following is an attempt to calculate the stress under the conditions stated, but it must not be looked upon as more than a very rough approximation. The chimney shaft will be in the condition of a cantilever loaded throughout its length; therefore

$$\Delta = \frac{P L}{8 E I}$$

where Δ = deflection in feet; L = length (height) in feet; P = total wind-pressure in tons; E = modulus of elasticity in tons per sq. ft. ($450 \times 144 = 64{,}800$); I = moment of inertia.

Then by transposition

$$P = \frac{8 E I \Delta}{L^3}$$

$$\text{Now } I = \frac{\pi (D^4 - d^4)}{64}$$

$$= \frac{3{\cdot}1416}{64} (32^4 - 13\,3^4)$$

$$= {\cdot}0491\ (1{,}048{,}576 - 31{,}290)$$

$$= \text{say, } 50{,}000,$$

$$\text{and } P = \frac{8 E I \Delta}{L^3} = \frac{8 \times 64{,}800 \times 50{,}000 \times 1\,5}{454^3}$$

$$= \frac{38{,}880{,}000{,}000}{93{,}576{,}664}$$

$$= \text{say, } 400 \text{ tons.}$$

But also $P = \frac{2 I C}{D L}$ where P = tons distributed acting at centre of pressure; I = moment of inertia; C = maximum stress in compression per sq. ft. produced by wind; D = outside diameter at base in feet; L = height in feet to centre of pressure.

Then by transposition

$$C = \frac{P D L}{2 I} = \frac{400 \times 32 \times \text{say,} 225}{2 \times 50{,}000} = 28 \text{ tons per. sq ft.}$$

To this must be added the compression produced by the dead load of the brickwork.

$$W = 6{,}500 \text{ tons.}$$

$$A = \frac{\pi}{4} (D^2 - d^2)$$

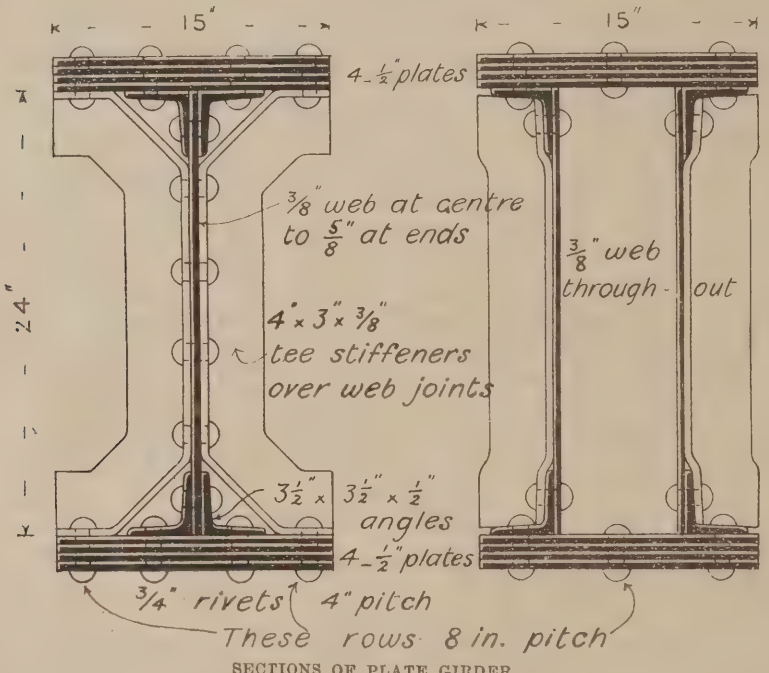
$$= 7854\ (32^2 - 13\,3^2)$$

$$= 665 \text{ sq. ft.}$$

$$W = \text{intensity of pressure per sq. ft.} = \frac{6{,}500}{665}$$

= say, 10 tons. Total intensity of pressure on leeward side in strong gale 28 + 10 = 38 tons per sq. ft. or, say, two-thirds of ultimate crushing strength. HENRY ADAMS.

Section of Plate Girder.



GRAVESEND.—C. J. P. writes: "Kindly state a simple formula for setting out the section of

a plate girder. I should also be glad to have an example worked out."

The simplest formula for sectional area of flange in plate girder is $A = \frac{W l}{8 d f}$

where A = gross sectional area of either flange in square inches,
W = distributed load in tons,
l = length of span } in same units,
d = depth of girder }
f = maximum stress allowed per square inch—say, 4 tons on wrought iron and 6 tons on steel:

but it must not be imagined that this is all the calculation needed in designing a girder. To put in all the figures that would have to pass through the draughtsman's mind would occupy four or five pages of foolscap closely written. Such a book as "The Practical Designing of Structural Ironwork" (Spon: 8s. 6d.) should be carefully studied and examples worked out. The following case is given by way of illustration, but is very much condensed and many of the details assumed without calculation as would be done at an examination. Example: Give design for a beam of 25ft. span to carry 80 tons distributed load. Wrought iron of stock sizes to be used, but no rolled-iron joists. Give calculations (Architectural Association, 1884). Assume 25ft.

SECTIONS OF PLATE GIRDER.

to be effective span. Weight of girder, $\frac{W l}{400} = \frac{80 \times 25}{400} = 5$ tons. Total load distributed, $80 + 5 = 85$ tons. Maximum shear stress, $\frac{85}{2} = 42.5$ tons. Depth of web, say, 2ft.; mean depth, 25½in. Thickness of web, $\frac{42.5}{3 \text{ tons per sq. in.}} = 14.17$ sq. in., $\frac{14.17}{24} = .612$in. thick; say, single web ⅝in. thick, or box girder, 2 webs, each ⅜in. thick. Maximum stress in flanges $\frac{W l}{8 d} = \frac{85 \times 25}{8 \times 25\frac{1}{2}} = 125$ tons. Sectional area of flange $\frac{125}{4 \text{ tons per sq. in. gross}} = 31.25$ sq. in. Angle irons, say, $3\frac{1}{2} \times 3\frac{1}{2} \times \frac{1}{2}$. Flanges, say, 15in. wide × 2in. thick, i.e., 4 − ½in. plates. Say ¾in. rivets 4in. pitch. HENRY ADAMS.

Plans for Drainage of Houses.

WALTON-ON-THAMES.—R. R. writes: "A engaged B to prepare plans for drainage connections to twenty-nine houses. The plans were made and passed by the Urban District Council. A day or so after A died. C, being solicitor to the estate, introduced a *personal* friend, D, to carry out the proposed work. D preferred to make his own plans, which were rejected by the Urban District Council, the plans prepared by B being adhered to. As the work was not done according to the regulations of the Council, and the workmanship was very inferior, B complained to the Council that it should have been passed by the sanitary inspector. This was about six weeks ago, but up to the present B has not heard anything from the Council. But as B lived in one of the houses, and had done so for twelve years, he was served with notice to quit, which he did within the week. (1) C being solicitor and trustee to the estate, and also clerk to the Urban District Council, was it legal for him to employ D in the capacity of his engineer and to uphold him in carrying out work not in accordance with the requirements of the Council? (2) Being trustee to the estate, was it legal for him to continue to have such work done after knowing it was detrimental to the property? (3) Has B any remedy against the estate? (4) How does the sanitary inspector stand in respect to the Local Government Board, he having been in the habit of canvassing for and making plans for drainage connections (some of which no council could possibly pass), and passing the work in complete disregard to the regulations of the Council?"

(1) There is no legal objection to C employing D as engineer to carry out the work, nor is C responsible to the Council for the manner in which the engineer executed the work. (2) The trustee to the estate presumably employs a properly-qualified engineer to superintend the execution of the drainage work, and the responsibility for the way in which the work is performed rests with the engineer. (3) B can claim against the estate for the preparation of the original plans. (4) A sanitary inspector should occupy a perfectly independent public position, and, speaking generally, is not permitted to engage in paid private work of such a nature as may interfere with the proper performance of his official duties. T. E. C.

Colonial Appointments for Professional Men.

BELFAST.—H. L. V. writes: "I should be glad to know if you could give me a list of Government appointments open to architects and surveyors in Canada, British Columbia, Egypt and India, and where full particulars of such appointments (especially those in Canada and British Columbia) may be obtained."

There was formerly a book published containing all the information required, and it can probably be still obtained from John Pulker, Esq., Emigrants' Information Office, 31 Broadway, Westminster, S.W., upon enclosing a P.O. for 1s.

HENRY ADAMS.

R.I.B.A. and Other Certificates.

LONDON, N.E.—R. H. O. writes: "Being desirous of obtaining a certificate from one of the following: R.I.B.A., the Institute of Civil Engineers, and the Surveyors' Institution, I should be glad to know what subjects need to be studied, and which of the three certificates mentioned would be easiest to obtain. I may say I have passed the advanced Building Construction examination."

It would be best to write to the secretaries of the three bodies mentioned, and to those of the Society of Architects and the Incorporated Association of Municipal and County Engineers also, for particulars of the examinations which they conduct. Their addresses are: R.I.B.A., 9 Conduit Street, W.; the Surveyors' Institution, and also the Institute of Civil Engineers, Great George Street, Westminster, S.W.; the Society of Architects, St. James's Hall, Piccadilly, W.; and the Incorporated Association of Municipal and County Engineers, 11 Victoria Street, S.W. The certificate mentioned is but a poor qualification compared with that of membership of any of these bodies, and we would suggest that our correspondent select which to work for, rather with regard to his tastes and the value of the qualification to him in after life than on account of the ease with which the examination could be passed.

G. A. T. M.

Books for R.I.B.A. Intermediate Examination.

BOLTON.—STUDENT writes: "Kindly recommend the best text-books for the following four subjects for the Intermediate R.I.B.A. examination:—Classic ornament; characteristic mouldings and ornament of each period of English Architecture from A.D. 1000 to A.D. 1550; the Orders of Greek and Roman Architecture, their origin, development and application; outlines of the history of mediæval and Renaissance Architecture in Europe."

To a great extent the four subjects mentioned must be considered as but branches of one for the purposes of study. In our opinion the best books to obtain are Hamlin's "History of Architecture," Sturgis's "European Architecture," Spiers' "Orders," Rickman's "Gothic Architecture," Colling's "Ornament" and Anderson's "Italian Renaissance." The study of these books should, however, be supplemented by plentiful sketching and measuring. Good examples of Gothic work are to be found in most parts of England, but for Classic detail it is necessary to work in the British Museum. G. A. T. M.

Stained-Glass Windows.

NANTWICH.—E. H. E. writes: "I have recently designed a stained-glass window with a representation of Christ in two characters, namely, The Light of the World and The Good Shepherd; shown by His carrying a lantern in the left hand and a lamb on His right shoulder. This appears to be unusual. Is it on this account canonically or in any way incorrect?"

The subject of the Good Shepherd is essentially one of those belonging to early Christian art, and occurs continually in wall-paintings and on sarcophagi until the seventh century, after which it is rarely met with until modern times. It was treated from several points of view, as in the abstract sense, the shepherd seated with his flock around him, the shepherd grieving over the loss of the sheep, the shepherd catching it (generally by the tail), and the shepherd bearing the recovered sheep home on his shoulders in various fashions. This last is generally also considered to be a symbol of the Resurrection. There can be no question of its being canonical. With regard to the other subject—which I believe was invented by Mr. Holman Hunt—objections were made to the title "The Light of the World" on the score of the light streaming from the lantern and not from Christ, and he altered it and exhibited the picture as "The Light of the Word," though the engravings were published under the original title. Mrs. Jameson does not even mention the subject, which indicates that it is one of purely modern growth. At the same time the symbolism is intelligible and may be considered legitimate, but if the lantern be objected to I would suggest that it might be explained as that which the shepherd had used to seek out his sheep. A. W.

Size of Joists and Stanchions.

PECKHAM.—J. B. writes: "In a small factory of three floors (ground floor, first floor, and second floor), with 8in. concrete roof, it is proposed to have steel stanchions, made out of rolled steel joist. What should be the size of the joist, size of base, &c.? The floors are to carry 2½cwt. per sq. ft., and the roof 1½cwt. per sq. ft. The heights of the floors are respectively 12ft. 6in., 11ft. 6in., and 10ft. 6in. The walls are 18in. thick. I enclose plan (not reproduced). Also, what should be the size of joists which the stanchions carry for the floors and the concrete roof?"

In this case there is a factory of three floors consisting of a main block of 56,000 cub. ft. and an annexe of 25,600 cub. ft., where all the interior and roof are to be of steel construction. If the correspondent is in difficulty in regard to any particular part, the columns of THE BUILDERS' JOURNAL are the right place to look for assistance, but to ask for complete details of the whole construction is unfair to those experts who make it their business to advise on such matters; besides, a full answer would involve a considerable amount of labour, and occupy too much space, in view of the limited interest the subject would have for other readers. Approximately, 9 × 7 × 58 lb. rolled-steel joists will be required for the stanchions, with a base 2ft. 6in. square on a stone 3ft. 6in. square; for the main girders in floors and roof 12 × 6 × 54 lb. rolled-steel joists; and for cross girders of roof 8 × 4 × 25 lb. joists 4ft. apart. Care must be exercised in all the connections.

HENRY ADAMS.

Ancient Lights.

MARGATE.—C. F. H. writes: "B has agreed to allow A (his next-door neighbour) to carry up some back additions, which will take away B's right of light, provided A will build B a skylight as per sketch (not reproduced). Will B lose his right of light after a certain number of years if he does not demand a yearly nominal fee so as to keep his right of light, as B may build a second storey on his office, in which case he would require A to take down his new additions? Should there be a written agreement between the two parties?"

B loses his right of light over A's property when he allows A to raise his building so as to obstruct B's light; and he cannot subsequently require A to take down his new additions. There should be an agreement between the parties to provide against A acquiring a right of light through any windows in his new addition over B's property. Otherwise A would acquire such right by 20 years' user, and so prevent B raising his building. G. H. B.

Performance of Contracts.

MORGANWG.—A CONSTANT READER writes: "I am a builder and contractor. Among the jobs which I have on hand at present is the conversion of an old warehouse into a double-fronted corner lock-up shop and a sitting-room, to be used in connection with business premises already existing. I prepared specification and estimate, which were accepted. There was a clause in my estimate to the effect that payments were to be made in two instalments, half when half the work had been done and the remainder on completion. What I want to know is, if I consider that I have finished the job according to the specification and the proprietor says that he is not satisfied and consequently will not settle, shall I not be entitled to hold possession of the lock-up shop?"

You cannot take possession of the premises unless your agreement gives you express power in writing, and this does not appear to be the case. A. O. H.

Books on Building Construction.

NEWCASTLE.—A. C. writes: "I am desirous of passing the Elementary Building Construction Examination which takes place in May. What is the best book on that subject to study?"

Rivington's "Building Construction," vol. 1. 8s. (Longmans, Green and Co.); or Mitchell's "Building Construction and Drawing:" First stage. 2s. 6d. (Batsford.)

Interior Perspective.

DARWEN.—SUBSCRIBER writes: "Kindly name a good book on 'Interior Perspective.'"

"Linear Perspective," by G. A. T. Middleton, A.R.I.B.A., 1s.; and "Architectual Perspective," by F. O. Ferguson, 3s. Published by Mr. B. T. Batsford, 94 High Holborn, W.C.

Second-hand Books.

DERBY.—W. H. C. writes: "Where can I obtain a second-hand book upon Civil Engineering, Land Surveying, and Levelling in London?"

Apply to Messrs. H. R. Hill and Son, Mr. S. H. Lazarus, Mr. Joseph Solomon, Messrs. Albert I. Myers and Co., or Mr. William Ridler, all of Holywell Street, Strand, W.C., and Mr. B. T. Batsford, 94 High Holborn, W.C.

THE FORUM EXCAVATIONS.

A SUMMARY BY MR. RUSHFORTH.

AN interesting summary of the most important results obtained last year by the excavations in the Forum at Rome was given in a long letter from Mr. Rushforth, director of the British School at Rome, published in the "Times" for January 9th.

The greater part of the Basilica Æmilia, for the excavation of which in the first instance the world has to thank the liberality of Mr. Lionel Phillips, has now been laid bare. Private property bars any further advance for the present; but one can walk upon the marble flooring of the great hall and wonder what was the catastrophe which would explain the large quantity of half-melted copper coins of the fourth century which have been found there. Everywhere are traces of fire; notably on the fragments of the columns of African marble which divided the nave from the aisles. It is difficult not to believe that these are the columns which Pliny says made the Basilica "wonderful." By a slip which is pardonable in an encyclopædist, he calls them Phrygian marble ("Pavonazetto"). The fragments show that the columns were nearly 3ft. in diameter, which would give a height of about 30ft.; and there was besides a corresponding series of rather smaller size on the upper storey. A complete set of columns of these proportions might well be said to excite admiration. To use no other argument, it is incredible that if, as has been suggested, the "Pavonazetto" columns were carried off to St. Paul's without the Walls in A.D. 386, the same age could have replaced them by these splendid monoliths of "Africano." The idea carries its own refutation with it.

Below the pavement of the Basilica a great sewer, with side-walls of travertine, coming from under the Via Cavour, has been opened. Just where it passes under the steps which led up from the street to the outer arcade of the Basilica the base of a small circular shrine projects into the roadway. It has been suggested that this is the temple of Venus Cloacina, the cleansing goddess.

The western end of the Basilica and a portion of the ancient street which separated it from the Curia have been laid bare, but as yet nothing has been discovered to throw any light on the temple of Janus which was somewhere close by. For the present the monastery buildings attached to St. Adriano stop further progress. Some interesting excavations in the later roadway opposite to this angle of the Basilica have revealed in excellent preservation a fairly early tufa pavement of the Republican Forum. The way in which the slabs are set, obliquely to the lines of the buildings and streets of post-Cæsarian times, is a good illustration of the original orientation of the Forum.

The greater part of the Comitium has now been laid bare, but it is not yet possible to estimate the various layers of which it is composed. The most striking objects which have been found on its upper surface are the pedestal of a statue to Mars and the founders of Rome set up by Maxentius (306–312), and the base of a fountain immediately opposite to the door of the Curia (St. Adriano). Mr. Rushforth suggests that this represents the fountain of Tarpeia, but thinks it is perhaps safer to suppose that the fountain belongs to a rather later age, and formed the *cantharus* in front of the church which Honorius I. constructed in the Curia about the year 635.

Leaving the Black Stone and the primitive objects beneath it, about which no further material facts have been discovered, we pass to the curious structure which has been unearthed between the Imperial Rostra and the Temple of Saturn and forms, according to one theory, the Rostra built by Julius Cæsar when he changed the orientation of the Forum. Below a platorm finished with a plain cornice, a row of eight low arched chambers, so small that they may be described as cells, faces the central area of the Forum. The tufa construction, which might well belong to the first century B.C. and is peculiarly neat in finish, has been completely covered with stucco. The floor of the chambers is paved with brick tesseræ, and this extends continuously for some way in front of the structure. The effect of the whole, though neat, is plain to a degree—even humble.

Another series of discoveries of very great interest has taken place at the opposite extremity of the Forum. On the south-east side of the Temple of Castor and exactly opposite to the three columns which alone remain standing, the Lacus Juturnae has been found, just in the position in which it is marked, though not named, on a fragment of the ancient plan of Rome now in the Capitoline Museum. The Lacus is a deep rectangular reservoir lined with marble. The centre is occupied by a large oblong base of masonry, also faced with marble, upon which no doubt stood side by side, as is suggested in the ancient plan, the pedestals with Castor and Pollux holding their horses.

There is a small group of chapels to the south-east of the Lacus, and in these some pieces of sculpture have been found, mostly poor work of the second century A.D., or even later. Immediately to the right of these buildings rises the shrine of Juturna, a tall niche of brickwork originally cased in marble. The shrine, though in its present form of comparatively late date, has preserved the original orientation facing north.

Finally we come to the great church which has been revealed by the removal of S. Maria Liberatrice and the ground behind it. At right angles to the entrance, and immediately behind the shrine of Juturna, is a smaller church, which, as the well-preserved eighth-century fresco of the apse shows, must have been dedicated to the Forty Martyrs. The principal church consists of the two great halls which, constructed in the second century between the Palatine Hill and the massive brick structure known as the Temple of Augustus, were partly remodelled in Christian times and completely decorated internally with painting. What was this church? On December 21st last the discovery of an inscription answered the question and put an end to a long controversy. It is S. Maria Antiqua—"Old St. Mary's," as we should say. It was already "old" by the middle of the seventh century, when it is first mentioned.

Of the two halls of Classical times, the outer, though not open to the sky, was perhaps treated as an atrium, as shown by the numerous burial recesses (*loculi*) excavated in its walls. Its sides, at least, were completely covered with paintings, but they have suffered so severely that little of importance can be made out. The inner church is far better preserved. In places the frescoes on the walls are to all intents and purposes as fresh as the day that they were painted, and the architectural arrangements are fairly easy to trace. An apse has been hollowed out of the back wall of the square sanctuary which is flanked by two chapels, while the nave of the church was separated from the aisles by two granite columns on either side. Low screens divided up the space in a curious way. Every inch of the surface of walls, screens and columns was covered with painting. Most of that which has survived belongs demonstrably to the middle of the eighth century.

Fragmentary as are the remains, and poor from an artistic point of view as is the work of the eighth century which forms the bulk of them, they are nevertheless of immense importance for the history of painting as helping to bridge the gap between the end of the Classical tradition and the beginnings of the Italian Renaissance, just where the evidence has hitherto failed us. It is feared that the paintings, now that they are exposed, will soon lose the freshness of their colouring, as, indeed, some have done already.

New Patents.

These patents are open to opposition until February 19th.

1899.—Cement Manufacture.—22,549. J. C. GOSTLING, College Hill Chambers, Cannon Street, J. H. FRAZER, Millwall, and R. BOOTH, 110 Cannon Street; all of London. This invention relates to the combination with a rotary kiln and gas-supply apparatus of an air-heating device, so arranged that the hot burnt cement is brought into contact with the in-rushing air immediately on leaving the kiln and before it (the cement) has been materially reduced in temperature. By this means a very high temperature is maintained in the kiln.

Blocks made of Granite Waste, Slate Waste, &c.—24,812. E. REESE, Mount Pleasant, Machynlleth, North Wales. Refuse from granite, slate, or stone quarries is mixed with 3 per cent. of tar, 5 per cent. of bitumen, sulphur between 5 and 10 per cent. of the quantity of tar and bitumen, and alum about 50 per cent. of the amount of sulphur. Blocks are moulded with this mixture in the usual manner.

Smoke-consuming Fireplaces.—25,124. A. J. BOULT, 111 Hatton Garden, London (communicated by G. A. Mahler and M. Friebe, both of Dresden, Saxony). This smoke-consuming fireplace has a closed or "blind" chamber above the grate, from which the evolved gases are drawn through the grate, air-inlet passages being arranged immediately above and below the level of the grate surface.

1900.—Dovetail Threads.—8,839. W. C. FISCHER, 29 Gillingham Street, Pimlico, London, S.W., This invention consists of a dovetail-shaped male and female screw-thread. It has special reference to the joining together of the two halves of split pulleys.

Scaffolding.—12,498. I. SZALAY and J. KOROM, both of Budapest VII., Hungaria ut 79, Hungary. This scaffolding consists essentially of upright standing ladders braced together with diagonal struts. Collars or sockets are provided at the top of the ladders for the addition of other ladders, and boards are placed across the rungs at intervals to act as platforms.

The following specifications were published on Saturday last, and are open to opposition until February 28th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—25,158, GREENHALGH, waste-water closet apparatus. 25,216, HEYL-DIA, electric cable conduits. 25,621, LUNDBERG AND LUNDBERG, electric-light switches.

1900.—410, DUFF, gas producers. 504, SMALLCOMBE, hoists controlled by friction. 506, THOMSON, kitchen ranges. 1,336, CHICKEN AND SMITH, apparatus for purifying acetylene gas. 1,718, CHADWICK, channelled dishes for gully traps. 2,405, GULLYES, GULLYES AND GULLYES, locking devices for taps, &c. 2,670, HUTCHISON AND PACKARD, electric incandescent lamps. 2,740, GREEN, construction of fireproof floors and roofs. 3,097, GREEN, doors and apparatus for supplying air to furnaces and kilns. 3,227, PYE, humidifiers and ventilators. 3,258, SPOONER (*Neveur*), electric switches. 3,262, LAKE (*American Wood Fireproofing Company, Ltd.*), fireproofing of wood and other combustible substances. 3,305, RIGBY, guard for circular saws. 3,423, PROPERT, water closets. 3,528, HICKS, levels. 3,631, gas producers. 4,046, HEMINGWAY AND COLEY, fusible cut-outs for electric installations. 4,181, ECKLEY AND FRANKHAM, gate hinges. 5,142, DOHM, calculating apparatus for ascertaining the section of beams, girders, columns, &c. 5,358, GODREJ, locks. 7,107, DANNHARDT AND MAILER, deep-boring earth or rock drill. 9,314, HOPTON, appliance for fitting to band saws for cutting wood on the twist or wind. 11,562, HEWITT, electric lamps. 12,816, MILLER, hand street-sweepers. 13,134, WALTON, electric arc lamps. 14,743, CLAYTON, electric cut-outs. 17,071, LESTER AND DEAN, refuse furnaces. 18,343, SEITZ, centrifugal pumps. 18,950, HOFF AND HAGLIN, concrete piles. 19,120, JAHN, chimney, ventilating, and similar shafts. 19,327, CHISHOLM, manufacture of metal-pipe unions. 20,107, COPELAND, portable walls or ceilings. 20 636, KENNEY, valves for water closets. 20,731, CROFT-SMITH, portable scaffoldings. 20,921, ADAMS, jointing sanitary ware and metal. 20,922, ADAMS, closets. 21,059, WETTER (*Beck*), slabs or plates for asphalt and similar pavements.

Surveying and Sanitary Notes.

A Proposed Manchester Park.—A Local Government Board enquiry was held recently into the application of the Manchester Corporation to borrow £12,500 for laying-out Brookdale Estate, Newton Heath. The estate was recently purchased by sanction of the Local Government Board for £26,500.

A Much-needed London Improvement.—A meeting of influential traders and ratepayers of St. Pancras has been held to consider the question of widening the Hampstead Road at its junction with the Euston Road, and a committee, including representatives from all the large business houses in Tottenham Court, Euston and Hampstead Roads, was formed with a view of bringing the matter before the London County Council as a metropolitan improvement. The congestion of traffic at this corner is now so great that it is of the utmost importance that something should be done to relieve it.

Sewer Ventilation.—In a system of sewer ventilation now being introduced by Messrs. J. Stone and Co., of Deptford, water is employed as a means both to extract foul gas from the sewer and to purify it before it is discharged into the atmosphere. The apparatus consists of a small tank which is placed at any convenient position in the upper part of the sewer. In this tank, which is always filled with water up to a certain level, there is an ejector arrangement, laid horizontally, which is worked by a jet of water derived from the ordinary water main. The mere act of admitting the water from the main puts the apparatus into action, and it so continues until the water is shut off. The suction produced by the jet is arranged to do three things:—First, to draw in water from the tank (the ejector arrangement being submerged); secondly, to suck in air from the sewer; and, thirdly, to suck in fresh air from the outside. Thus the sewer gas is thoroughly churned up with clean water and fresh air by the action of the jet, and the result is to wash it of its offensive constituents, the water after use passing away down the sewer, while the purified air escapes to the atmosphere. The cost of water for treating 10,000 cubic feet of gas is put at about 1s. 6d., and it is considered that only intermittent employment of the apparatus, at times when the ordinary means of ventilation are particularly inefficient, would be required. One machine, it is stated, could deal satisfactorily with half a mile of sewer, and the cost of its installation would compare favourably with that of the tall ventilating shafts which are employed in some districts, even if they were erected only at such long intervals as 200 or 300 yards.

A New Theatre at Newcastle-upon-Tyne is to be erected. It will be called the "Royal."

Professional Practice.

Aberdeen.—An improvement has been effected in the hall of the Y.M.C.A., Union Street. Formerly the hall was seated only for 650 persons, and presented a very plain appearance. The hall has now been enlarged so as to accommodate 1,000 persons. It has been redecorated, and its acoustic properties improved. The platform, which formerly ran along the west side, has been removed to the south end, and the two recesses which flanked the former east gallery have been thrown into the hall, while an elaborate new gallery now runs round three sides. By these changes the hall has been made rectangular in shape, while 350 additional seats have been obtained. A new covered passage with a fire-proof stair to the gallery is in course of construction on the east side, and will be continued out to the line of Union Street, thus doing away with the old entrance court, and providing a new public entrance to the hall. A retiring room and cloakroom accommodation have been provided, and the hall is now fitted with an installation of electric light, and new heating and ventilating apparatus. The scheme of decoration has been carried out by Messrs. Gordon and Watt, painters. The lighting of the hall has been greatly improved by the removal of the former alcove lights, and the insertion of roof lights, while artificial illumination is brilliantly effected by numerous electric lamps. The alterations, which have been designed by Mr. A. C. Bruce, architect, are estimated to cost from £1,400 to £1,500, and the contractors are Mr. Alexander Hall, carpenter; Messrs. James Stephen and Son, plasterers; Messrs. Blaikie and Son, plumbers; Messrs. Gordon and Watt, painters; Messrs. Pratt and Keith, electricians; Mr. William Coutts, slater; and Mr. Robert Tindall, heating engineer.

Bristol.—The Bristol Council have approved of the plans submitted on behalf of Sir William Henry Wills for the new art gallery that gentleman has offered to erect for the city, the Council undertaking to carry out in conjunction with it a much needed enlargement of the Museum, which institution the new gallery will adjoin. The plans have been prepared by Mr. Frank Wills, in association with Messrs. Houston, of London. The architects' description of the accommodation is as follows:—On the ground floor there are two large rooms, one 63ft. by 35ft., and the other 63ft. by 33ft. 3in.; two other rooms, 43ft. by 29ft. 6in. each. The height of these rooms will be about 25ft., in accordance with the Town Clerk's letter, so that in the event of an extension of the premises being required, gallery space around these rooms could be obtained. The gallery around the hall leads to rooms that could be used as refreshment rooms and other offices. The Art Gallery on the top floor consists of two large rooms, each 64ft. by 30ft.; two smaller rooms, each 43ft. by 30ft., and a fifth room 47ft. 6in. by 30ft. The basement, to which there is a separate entrance, contains storage space, workshops and heating apparatus, together with other offices. A lift will be provided from the basement to each floor.

Chester.—A new practising school has been erected at a cost of £4,000 in connection with the Chester Diocesan Training College. The new school, a large brick block, which has a frontage to Parkgate Road and stands in the middle of a large gravel playground, has been designed by Mr. H. Beswick, Chester, and built by Mr. W. W. Freeman. Accommodating 300 children, as compared with 200 in the case of the old school, it consists of a large central hall, with gallery, five commodious class-rooms, headmaster's room, cloak room, lavatory, &c. The floors are all of wooden blocks, there is an improved system of heating apparatus, and the building is lighted throughout by electricity.

Grange.—A new council-hall and assembly-room has been opened. The site of the building is a central and commanding one, about halfway up the main street between the railway station and the Crown Hotel. Mr. Hutton, of Kendal, was the architect for the new hall, which was designed in conjunction with the council offices and bank premises, the work

being carried out as one scheme. The block of buildings facing Main Street has a frontage of about 70ft. and is devoted to council, office and bank purposes; the rear portion of the building standing at right angles to the main front is the public hall. The style adopted is Renaissance, freely treated, and the material employed is local limestone, with Prudham freestone dressings. The hall is entered from Main Street through a vestibule the width of the council offices, which gives easy access, an additional porch being built on the adjacent side of the hall for the quick exit of the audience. The hall is 70ft. long and 36ft. wide, with a ceiling height of 30ft., and is lighted by six large windows and two ceiling lights of stained glass. The internal decoration of the hall has been treated in the same style of architecture as the main building, having around the walls pilasters with fluted shafts, bases and enriched capitals, arcaded walls between pilasters, carrying an ornamented frieze and cornice. From the pilasters spring the main ribs of the coved ceiling which divide the ceiling into bays transversely and longitudinally, smaller ribs being inserted between the main ribs, forming a panelled ceiling. A panelled pine-wood dado runs around the hall and forms also the front of the stage. The stage is of ample proportion and approached from the hall by two small flights of steps, and has direct communication with the retiring rooms. The lighting is by wrought-iron ornamental sun-burners in the ceiling and copper and iron brackets around the walls, the stage being fitted with the latest style of footlights. The heating is done by iron radiators placed in the window recesses. Retiring rooms have been provided for the use of stage and hall. The total cost of the whole block of buildings was about £4,000, the hall costing about half of this amount. The contractors were: Building, walling, and mason work, Mr. Enoch Denny; joinering, Mr. W. Till; plumbing and gas-fitting, Mr. B. Ward; painting and glazing, Mr. W. Braithwaite; plastering, Mr. J. Chippendale.

Kingston-on-Soar.—The church of St. Winifred, Kingston-on-Soar, has recently been rebuilt and restored at a cost of between £4,000 and £5,000. Owing to the condition of the church it was found necessary some time ago to pull down the whole of the main part, which was erected about 60 or 70 years ago, the original plan of rebuilding embracing a nave, south aisle, vestry and porch, with a square embattled tower at the west end. After the commencement of the work it was discovered that the walls of the interesting old chancel and chapel, which survived the last restoration, were so much out of the perpendicular, and in such an insecure state, that it was advisable to take them down and put in new foundations. This has accordingly been done, care, however, being taken to rebuild on exactly the same plan, and put back every suitable stone in the position it formerly occupied, while all the windows and traceried work have been replaced. In the chancel stands an ancient and curious old canopy for the tomb of Sir Anthony Babington, and this was not removed during the work of rebuilding. The designs, which were executed by Mr. Richard Creed, F.R.I.B.A., of London, were in the late Perpendicular style, and harmonised throughout with the old chancel. The walls are built of Coxbench (Derbyshire) stone, with Weldon stone dressings, and the roof of the chancel is of oak, the floor being laid with tesselated tiles, specially designed by the architect. In the tower has been placed a large clock and three bells (supplied by Messrs. Taylor, of Loughborough), provision being made for seven bells which it is hoped eventually to place there. The church has been reseated throughout with wainscot oak and a reredos included. The whole of the work of rebuilding has been carried out by Messrs. Walker and Slater, of Derby. The internal fittings are of a very complete and substantial character, and the edifice is heated throughout with hot-water pipes and lighted by gas.

London, S.W.—The new wing of St. John's National Training College, Battersea, S.W., illustrated on this page, has recently been erected. The institution has made great strides since its start some years ago with only about eight students owing to the energy of the Principal, the Rev. H. Wesley Dennis, and will be still further enlarged shortly. The materials used are dark red-brick dressings and piers, with picked yellow stocks on the ground floor between and rough-cast on first floor. There is a specially-moulded terra-cotta cornice moulding under the eaves. The Mansard roof is of green slates. On the ground floor are a lecture room and two classrooms; on the first floor two studying rooms, two masters' bedrooms and twenty cubicles; and on the second floor a temporary art room and physical laboratory. There is a double system of heating—hot water and open grates. The architect was Mr. Arthur H. Ryan-Tenison, A.R.I.B.A., and the contractors were Messrs. Barker and Co., of Kensington.

ST. JOHN'S NATIONAL TRAINING COLLEGE, BATTERSEA, S.W.: NEW WING. A. H. RYAN-TENISON, ARCHITECT.

Workmen's Dwellings in London.—A deputation of the London County Council has visited Glasgow to enquire into the question of workmen's dwellings, a subject with which the Glasgow Corporation successfully dealt some years ago.

Correspondence.

Use of Centrolinead for Perspectives.

To the Editor of THE BUILDERS' JOURNAL.

SIDMOUTH.

SIR,—I am obliged to Professor Adams for his endeavour to further explain the use of the centrolinead and how to set it. I should have replied before, but I wished to see whether anyone else had any explanation to offer; and I was pleased to see in last week's issue that two more gentlemen have essayed an explanation. Of Mr. Ramm's remarks it is perhaps only necessary to say they show a confidence which is born of ignorance. As a past student of the Royal Academy I am aware that Mr. Phené Spiers is the master of the architectural school, and that he is a clever man; but if Mr. Ramm's quotation from him on this subject is complete, then all I can say is he is not very explicit, as he says not one word about how the instrument is set, and that is the only question I ask. Mr. Griffiths' description is somewhat involved, I think, but he is on the right track; even he does not state how the positions of the pins or studs on which the arms work are determined.

The question is simply this:—You have set out your plan and determined your vanishing points, and the long one is, say, 20ft. off the board. How will you set the centrolinead to work as from that point?

I can set the instrument perfectly accurately and fix my guiding pins with the simple aid of a set-square and without any further diagrams than that formed by the horizontal line and the line of the top of the building. This method was discovered by my master, Mr. Henry Hopton, who holds the secret, which I do not feel at liberty to divulge. But, as I said before, in my limited experience I have not found anyone, except Mr. Hopton, having a straightforward simple method of setting the centrolinead. I therefore ventured the opinion, which I repeat, that it seems a strange thing that a man should invent a thing which he could not use, as according to Professor Adams' first answer Mr. Nicholson was indebted to Mr. Bryan for an explanation of how to use his (Mr. Nicholson's) instrument.—Yours truly,

R. W. SAMPSON.

Law Cases.

Scaffold Accidents. — Joiner's Successful Claim.—At the Gateshead County Court last week, before his Honour Judge Greenwell, arbitration was applied for on behalf of John Gradon, a joiner, of Pelton. The facts of the case were that on August 28th, 1900, the applicant was working at Ouston, near Pelton, and with two other workmen was engaged on a building which was being erected for the Birtley Co-operative Society. The men were putting in a facia board above a window, when the scaffolding, which was over 30ft. in height, collapsed. The applicant sustained a fracture and dislocation of the cervical spine, resulting in complete paralysis below the neck. Gradon, by his work as a joiner, had been making 37*s.* 6d. weekly up to the time of the accident, and he now claimed for 18*s.* 9d. weekly. His Honour gave judgment for the payment of the amount applied for.

Architect's Claim for Services.—At last week's special sitting of the Wrexham County Court, before his Honour Judge Sir Horatio Lloyd and a jury, an adjourned action was heard in which Mr. John Harris, architect and surveyor, Wrexham, sought to recover from Mr. Edward Babb, of Rossett, the sum of £30 16*s.* This amount was made up of £20 16*s.* balance of account for professional services, and £10 for attending Chester Assizes under subpœna as a witness on the defendant's behalf in a certain case. There was a counterclaim of £150 damages, alleged to have been sustained by the defendant by reason of the plaintiff's incompetence and negligence as an architect. At the adjourned hearing Mr. E. J. Muspratt, from the office of Messrs. Douglas and Minshall, architects, of Chester, said the work was not completed when Mr. Harris gave his final award and declared the work to be finished. He found many defects in the buildings concerned. He discovered that best Ruabon dressed bricks had not been used, that the water came into the cellar, that snow got in through the roof, and that the outer walls were not bonded properly to the inner walls. The drains were badly constructed, and the work generally faulty. The jury found for the plaintiff on the claim and awarded him £36 10*s.*, and on the counterclaim they ordered the plaintiff to pay £82 14*s.*, while his Honour reserved his decision respecting a further sum of £40, a disputed account for bricks.

Dispute over Building a Church.—At the Wrexham County Court last week his Honour Judge Sir Horatio Lloyd gave judgment in a claim brought by Messrs. Rogers and Son, builders, of Brymbo, against Mr. W. F. Butler, proprietor of Vron Colliery, near Wrexham, for the sum of £15 2*s.* 9d. for extra work in connection with the building of Vron Church. His Honour, in reviewing the facts of the case, said that the Rev. Daniel Davies decided to build a new church at Vron. Mr. Butler gave the bricks, and took great interest in the erection. Mr. Butler was not altogether pleased with the original plans, and suggested certain alterations, including a screen, stalls and an altar. The vicar said he was quite agreeable to Mr. Butler altering the plans provided he was not made responsible for more than a certain sum, and that Mr. Butler was responsible for the extras. At the same time he wrote to the builders telling them that they must look to Mr. Butler for payment for any alterations he made in the plans. There was no doubt the plans had been altered by Mr. Butler, and that he had directed certain work to be done in the interior of the church to make it, if possible, a model church. He was of opinion that Mr. Butler, by his presence and interference, had made himself responsible for the money claimed; but he thought there should be no costs for the builders, who went to work without a definite contract, and also delayed the work. He gave judgment for the amount claimed, but allowed no costs of any kind.

Keystones.

A Masonic Temple at Newbury was dedicated recently, a block of ancient buildings formerly used for public purposes having been converted for the requirements of the Masonic Lodges in Newbury. A feature of the temple is the oak panelling. The style adopted is Jacobean.

Glasgow International Exhibition.—Messrs. Richmond and Company, Ltd., of Warrington, London, &c., have just secured one of the principal contracts for furnishing with their most modern cooking apparatus the kitchens, &c., of one of the catering pavilions at the coming Glasgow International Exhibition.

Architectural Association of Ireland.—At a meeting of this association held on January 8th a resolution was passed to the effect that the present system of pupilage concurrent with a compulsory collegiate training and qualifying examination affords the best promise for the architect of the future.

Leeds Improvements.—The City Council have decided to promote a Parliamentary Bill empowering them to make additional waterworks and for other purposes, including the erection of a crematorium, the consolidation of the city securities, and the adoption of the mansion on the Harehills Estate as judges' lodgings. The improvements will entail an expenditure of a million pounds sterling.

Ramsay House, Edinburgh.—In reference to the article on this building which was published in last week's issue, a correspondent states that the block next to the esplanade shown on page 432 was designed by Mr. Capper, now Professor Capper, of Montreal. The loch referred to as St. Mary's was anciently known as the "Nor' Loch." St. Mary's Loch is situated to the south, in the Border country.

A New Church at Long Eaton has been erected at a cost of £1,000 as a memorial to the late Canon Dolphin.

A Butter, Fish and Poultry Market at Douglas, I.M., is to be erected by Mr. Frederick Callow, builder, at a tendered cost of £2,170.

The Norfolk County Lunatic Asylum at Norwich is to undergo additions and alterations. The cost will be about £48,000, about £20,000 of which will be for electric light and engineering work.

A new Congregational Chapel at Brislington is being built. The building is to be of pennant stone with Bath stone facings, and the cost will be about £3,500. Mr. Frank Wills is the architect and the contractors are Messrs. Cowlin and Son. For the present it is only intended to erect the front elevation and so much to the rear as will accommodate 350 persons, but the plans provide for an extension to 800.

A new Sunday School at Rye for the Wesleyans has been erected. The building is about 35ft. wide, 60ft. long, and is of stock bricks with red brick facings and red-tiled open timber roof. There are six classrooms, with kitchen and offices. Inside the walls are cemented and wainscoted around the base. The heating is by hot-water pipes and the lighting by incandescent gas-lights. Mr. A. W. Pocock was the architect and Mr. Knock the builder.

A Reading and Recreation Room at Seascale has been erected on a site offered by the Furness Railway Company. The building is a wood pavilion with corrugated iron roof and is 55ft. long. It consists of three rooms: the games' room is 16ft., the news room 28ft. long, connected by a movable partition, so that the two rooms can be made into one for a lecture or concert. The third room is a private room or can be used as an ante-room for the platform. There is a porch with cloak-room accommodation.

A Statue of the Queen at Birmingham has been erected in the square in front of the Council House. It was executed by Mr. Thomas Brock, R.A. The statue is in its main design a replica of that executed by Mr. Brock for the city of Worcester in commemoration of the Queen's Jubilee in 1887. The figure is erect, standing 11ft. high, the medium being Sicilian marble. Her Majesty is represented in her Royal robes and bearing the sceptre and the orb in either hand. The statue is mounted on a richly-moulded pedestal of Cornish granite 12ft. high. To the right of the site is a statue of Priestley, and to the left one of J. Skirow Wright, a Birmingham worthy. The cost of the work was £2,000.

St. Mary's Church, Swaffham Prior, near Cambridge, is proposed to be restored. The walls on the north side, the arcades of the north and south aisles, as well as the three bottom stages of the tower, the two lowest of which are Early Norman, are in their original state. Sir A. Blomfield once said that he believed the form of tower at this church to be unique in England, the base being square, the second stage octagonal, and the third sixteen-sided, a graceful spire originally crowning the whole. It is now intended to rebuild the remainder of this church (whose chancel was restored twenty years ago) to mark the beginning of the twentieth century.

Architectural Association of Ireland.—The sixth technical demonstration of this society was held recently at the Engineering Works of Messrs. J. and C. M'Gloughlin, Limited, Great Brunswick Street, Dublin. After a brief but comprehensive sketch of the production and qualities of iron and steel, the members were conducted round the extensive works and shown the processes in operation of converting the ordinary or merchant bar iron into the finished article. Much interest was shown in the working of the enormous steam hammer and in the welding of two lengths of iron bar, which afterwards was submitted to a tensional test and found to be strongest at the joint. Punching, drilling, mitreing and sawing machines were seen at work, a feature of the demonstration being the beating up of iron foliage with the hammer.

A New Synagogue is to be erected at Finsbury Park, N.

The Annual Dinner of the R.I.B.A. this year will be held in Glasgow on Thursday, October 3rd.

Workmen's Dwellings are to be erected in Wedmore Street, Upper Holloway, N., by the London County Council.

A Memorial Church in Moss Vale, New South Wales, is proposed to be erected to the Australian soldiers who have fallen in the South African war.

A Statue of Lord Lansdowne has been erected at Calcutta at a cost of £4,650. The late Mr. Harry Bates, R.A., and Mr. Onslow Ford, R.A., were the sculptors.

A New Fire Station and Police Sub-Station, proposed to be erected at a cost of £29,200 at Bootle, formed the subject of a Local Government Board inquiry recently.

An Exhibition of Drawings by John Ruskin in water-colour will be held during February at the Gallery of the Old Water-colour Society, 5A Pall Mall East, S.W.

A Technical School at Tyldesley is to be erected in Upper George Street. Mr. J. Holt, of Manchester, has prepared the plans, and it is estimated that the total cost will be about £4,500.

The Danish Pavilion at the Paris Exhibition, which was bought by Sir George and Lady Lewis, is now on its way to England. The variety and beauty of the polished woods of Denmark will be well illustrated in this imported pavilion on the Links at Grimsby, its destination.

Mr. T. Walter L. Emden, L.C.C., president of the Society of Architects, has been presented with a valuable piece of plate in recognition of his services as chairman of the defunct London Board of Works; as member of the London County Council; and in connection with the Wimbourne Habitation of the Primrose League, of which he is Deputy Ruling Councillor.

Mr. W. W. Morris, architect and surveyor, of Middlewich, died last week at the age of 40 years. Prior to going into Cheshire Mr. Morris was in practice with his father in Bolton. At Middlewich he held several public positions, including the surveyorship to the Urban Council, and clerkships to the Parish Vestry and the consolidated charities.

Frescoes Discovered at Boscoreale. — These frescoes, as to the scientific importance of which the verdict of the Italian Government Commission has still to be pronounced, are preserved, after being carefully detached from their original walls, in a building opposite the railway station of Boscoreale. There are about 60 frescoes, some of which are marvellously fresh and undamaged by their long burial. Many are more than four yards square.

The Glasgow and West of Scotland Technical College Architectural Craftsmen's Society held a meeting last Friday evening, Mr. Alex. Davie, I.M., President, in the chair, when a lecture, entitled "An Architectural Craftsman's Visit to Italy," was delivered by Professor Gourlay, B.Sc., A.R.I.B.A. The lecturer began by recommending all architectural craftsmen to make at least one visit to the Continent, though for a short time only, to enable them to realise their insular position, and, further, as an incentive to reading and study. Whether disappointed, satisfied, or exalted feelings pervaded one when studying a building on the spot, the result of the study of worthy buildings either at home or abroad was to inspire the student to greater excellence in his future work than he had gained in the past. Beginning with Venetian architecture, a bird's-eye view of Venice was shown on the screen, and the many parts of the city and its buildings were pointed out. Thereafter views of buildings showing Byzantine, Gothic and Renaissance work in Venice, Ravenna, Verona, Milan and Vicenza were shown. Passing to Tuscany, the Romanesque, Gothic and Renaissance architecture of Florence, Siena, Pisa, Pistoja and Prato was reviewed; finally the Ancient, Early Christian and Renaissance architecture of Rome.

A new Town Hall at South Shields is proposed to be erected on the vacant site at the corner of Ogle Terrace and Westoe Lane; £25,000 is the largest sum the Corporation are prepared to expend on the scheme.

A new Church at Dewsbury is proposed to be erected in Moorlands Road. Plans have been prepared by Mr. John Tweedale (Messrs. Smith and Tweedale, Leeds). The land was generously given some time ago by the late Mr. John Tweedale, the architect's father-in-law. The chancel and east window will face down Willans Road, and the entrance to the church will be from Moorlands Road, where a tower is also to be constructed.

Improvements at Farnworth.—The Urban District Council have decided to erect a town hall at the estimated cost of £12,000. Plans have been approved for the building, which is to be erected on a site on the market ground. Much attention is also being directed to the development of the tramways and electric undertaking of the township. At present the Bolton Corporation work the electric cars in Farnworth, but the District Council have resolved to purchase cars of their own.

Ruskin in France.—Ruskin is about to engage the attention of the Sorbonne. M. Jacques Bardoux, a candidate for the degree of Doctor of Letters, has taken for the subject of his thesis, which he is to read before the learned examiners to-day, "John Ruskin and the Idealist and Social Movement in English Literature in the Nineteenth Century." The keen interest taken in the life and work of Ruskin by many young Frenchmen at present is most noteworthy.

A new Parish Church for Waverley Park, Lewisnam, to be known as St. Silas, is to be built on the now vacant triangle at the end of Ivydale Road, by Inverton Road. The new church will be in the diocese of Rochester. The architecture of the new edifice will be a reproduction of the more common style of modern church, except that the steeple will be only joined to the church itself by a corridor. Properly speaking it will be a square tower, not a steeple, built after the Tudor style. At the further end of the church on the roof is a small one-bell tower.

Truro Cathedral.—Owing to the continuance of unfavourable weather, the short days, and the Christmas holidays, the building of the nave has not been very rapid of late. The clerestory stage of the building is reached, and should the weather improve, the great circular or "rose" window, filling the gable of the west front, with its well-designed plate-tracery, will soon be fixed. The windows in the north transept have been ordered. There are three windows with two lights in each, and the subjects will be six of the ancestresses of Christ, viz., Eve, Sarah, Rahab, Ruth, Tamar, Bathsheba.

A Pompeiian Statue.—The fine Greek statue in bronze recently discovered near Pompeii has been placed in the Naples Museum, where examination has shown it to be covered with a layer of fine silver. This peculiarity gives the statue unique value, as there is believed to be no other bronze statue in the world so covered, though several of the more valuable Greek masterpieces, like the bust of Berenice and the Dancers of Herculaneum, in the Naples Museum, have their lips or their garments ornamented with silver. The fact that the bronze of the statue is completely covered with the precious metal is considered a proof that the Pompeiians themselves valued it highly.

Chichester Cathedral.—The dedication of the new north-west tower of the cathedral and the opening of the new wing of the Bishop Otter Memorial College, will take place on April 16th next. The rebuilding of the tower has now reached the full height of 96ft. Though the exterior has been completed, a certain amount of interior work has to be accomplished. The new tower has occupied two and a half years in building, and is a solid and substantial structure, not likely to share the fate that befel the central spire some years ago. The restoration of the chapel of St. Clement on the south side of the nave in memory of Bishop Durnford is now complete all but a slight matter of gilding.

"Restoring" a Reynolds.—Mr. Commissioner Kerr disposed of a case in the City of London Court recently, in which Mr. W. H. Thompson, of 524 Oxford Street, sued Mr. W. Graves, architect, of Winchester House, E.C., for £7 for restoring an oil-painting and providing a frame for it. The picture was by Sir Joshua Reynolds, the defendant's grandfather having been the great painter's engraver. The plaintiff was authorised to varnish the picture, which was a fine sketch of a head and shoulders, but it was stated he had added an arm, thinking, apparently, that Sir Joshua could be improved upon. The plaintiff indignantly repudiated the suggestion that the picture had been altered. It was more like one of Sir Thomas Lawrence's than Sir Joshua Reynolds's. When it was brought to him it was in a very dirty condition, and he was asked to "put it right." The defendant had paid £4 into court which the Commissioner said the plaintiff must be content with.

An old carved Pew.—The late Mr. William Nathaniel Forbes of Dunnottar and Auchernach, has bequeathed to the kirk-session of Auchernach the old carved panels of the Auchernach pew in order that they may be re-erected in the new church. Mr. Charles S. S. Johnston, architect, Edinburgh, states that these two fragments of what was latterly called the "Auchernach Pew" were removed to the mansion house of the same name on the demolition of the old Parish Church of Strathdon in the year 1834, being the property of Mr. Forbes. This pew was constructed in the year 1686 by his predecessor, William Elphinstone of Bellabeg. The initials and dates refer to the ancestors of William Elphinstone. The carvings were executed in strongly-grained Scottish fir or larch, and, having never been painted or varnished, possess a rich and attractive effect. Not a vestige now remains of the original church, nor of the one which was erected in 1757.

Manchester City Architect: A Dispute.—At the last meeting of the Manchester City Council considerable discussion arose in reference to a resolution of the Town Hall Committee to the effect that Mr. Meek, the Corporation architect, had forfeited the confidence of the Committee, and that he be requested to send in his resignation. The circumstances arose out of the erection of a workshop by the Corporation on a plot of land in Jackson's Row. One of the walls of the workshop, the plans for which were prepared by Mr. Meek, the work being carried out under his supervision, had settled down and had to be rebuilt. Mr. Meek had been held responsible for this because of certain action he had taken in cutting away the "footings" of the wall. The Lord Mayor said he thought the Committee should take the matter back for further consideration. The Council agreed that this course should be adopted, and that a resolution with regard to the clerk of the works on the building in question should also be referred back.

R.I.B.A. "Suggestions" for Architectural Competitions.—On page 426 of our issue for January 2nd last we published the revised paper of "Suggestions for the Conduct of Architectural Competitions." The proposals came before the business meeting of the Royal Institute of British Architects held on January 7th, when the revised paper was adopted with the following amendments:—Clause 2, section (*a*), reads: "To draw up the particulars and conditions (*as far as possible in accordance with the principles set forth in these suggestions*) as instructions to competitors, and *also* to advise upon the question of cost." Clause 2, section (*b*) reads: "To determine *whether* the designs conform to the instructions, and to exclude *any which do not.*" Clause 8 reads: "Where a deposit is required for supplying the instructions, it should be returned *either* on the receipt of a bonâ-fide design, or if the applicant declines to compete and returns the said instructions within a month after their receipt." Clause 4 reads: "The number and scale of the required drawings, &c. *Perspective drawings are not necessary; but if the assessor advises that they are desirable it should be so stated*; and such drawings should be uniform in size, &c." The words in italics are new.

New Companies.

Simplex Properties Company, Limited.

This company was registered on December 19th, 1900, with a capital of £2,000 in £1 shares to acquire the business of property owners, &c., carried on by N. Elliott and others, at 35 Villiers Street, Sunderland, Durham, as the Simplex Property Company, together with certain properties in Monkwearmouth and Sunderland, and to carry on the business of builders, contractors, lime, brick, timber, and hardware merchants, &c. Registered office: 35 Villiers Street, Sunderland, Durham.

G. H. Bulbeck, Limited.

This company was registered on December 19th, 1900, with a capital of £20,000 in £1 shares, to acquire the business carried on at Arundel and Littlehampton, Sussex, and elsewhere, by G. H. Bulbeck, and to carry on the business of timber growers and merchants, sawmill proprietors, iron merchants, &c. The first directors (to number not less than three nor more than seven) are G. H. Bulbeck, H. C. Bulbeck and W. F. Mapleston. Registered office: Shipyard, Arundel, Sussex.

New Pearson Pottery Comp any, Limited.

This company was registered on December 19th, 1900, with a capital of £3,500 in £1 shares to acquire the business carried on at Brook Street Potteries, Hanley, Staffordshire, as the New Pearson Pottery Company, and to carry on the business of china, stoneware, earthenware, encaustic and other tile and glazed brick makers, &c. The first directors (to number not less than three nor more than five) are G Hassall, W. B. Hackney and C. Wilcox. Registered office: Brook Street Works, Brook Street Hanley.

Penn Hill Park, Limited.

COMING EVENTS.

Wednesday, January 16.

NORTHERN ARCHITECTURAL ASSOCIATION.—Students' evening.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—Dr. Fryer, M.A., on "Fonts in Cornwall," 8 p.m.

SOCIETY OF ARTS.—Mr. H. Snowden Ward on "Photography of Natural Colour by the McDonough-Joly Process," 8 p.m.

ST. PAUL'S ECCLESIOLOGICAL SOCIETY.—Mr. F. Herbert Mansford on "Notes on City Churches," 7.30 p.m.

BUILDERS' FOREMEN AND CLERKS OF WORKS' INSTITUTION.—Annual Meeting at 8 p.m.

INSTITUTION OF CIVIL ENGINEERS.—(Students' Visit to the Ventilating, Warming, Drainage, and Lighting arrangements at the Houses of Parliament, 2.30 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Prof. G. Baldwin Brown on "Colour in Architecture," 8 p.m.

Thursday, January 17.

SOCIETY OF ANTIQUARIES OF LONDON.—Meeting at 8.30 p.m.

CHEMICAL SOCIETY.—Meeting at 8 p.m.

ROYAL INSTITUTION.—Dr. Arthur Willey, M.A., D.Sc., on "The Origin of Vertebrate Animals," 3 p.m.

SOCIETY OF ARTS (INDIAN SECTION).—Dr. John W. Evans, D.Sc., LL.B., on "Metalliferous Mining in India," 4.30 p.m.

Friday, January 18.

ARCHITECTURAL ASSOCIATION.—Mr. Edwin T. Hall, F.R.I.B.A., on "Flats," 7.30 p.m.

ROYAL INSTITUTION.—Prof. Dewar, M.A., LL.D., F.R.S., on "Gases at the Beginning and End of the Century," 9 p.m.

INSTITUTION OF MECHANICAL ENGINEERS.—Annual General Meeting at 8 p.m.

ARCHITECTURAL ASSOCIATION OF IRELAND.—Technical Demonstration at the works of Messrs. G. Rowe and Co., 22 Moss Street, Dublin: Mr. Malcolm on "Limes, Lathing, Plastering, Cement, &c.," 4.30 p.m.

Saturday, January 19.

BRITISH INSTITUTE OF CERTIFIED CARPENTERS.—Visit to Mansion House, E.C., at 3 p.m.

Monday, January 21.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Award of Prizes and Studentships, Mr. J. J. Stevenson, F.R.I.B.A., F.S.A., on "Difficulties and Hindrances in Producing good Modern Architecture," 8 p.m.

SOCIETY OF ARTS (Cantor Lecture).—Mr. J. Liberty Todd on "Elementary Art Education."—I., 8 p.m.

LIVERPOOL ARCHITECTURAL SOCIETY.—Mr. Ronald P. Jones, B.A., on the "Saracenic Architecture of Cairo."

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—Annual Dinner, 6.30 p.m.

SURVEYORS' INSTITUTION.—(Junior Meeting) Mr. L. S. Wood, F.A.S.I., on "Income Tax, Schedule A," 7 p.m.

Tuesday, January 22.

CARDIFF, SOUTH WALES AND MONMOUTHSHIRE ARCHITECTS' SOCIETY.—Mr. C. B. Fowler, F.R.I.B.A., on "Interesting Portions of Ancient Architecture in the Diocese of Llandaff."

ROYAL INSTITUTION.—Professor J. A. Ewing on "Practical Mechanics."—II., 3 p.m.

ARCHITECTURAL ASSOCIATION OF IRELAND.—Mr. P. J. O'Reilly on "Two Monts St. Michaels—Irish and Norman," 7.45 p.m.

GLASGOW ARCHITECTURAL ASSOCIATION.—Mr. R. Douglas Sandilands on "Hospital Planning."

Wednesday, January 23.

RUSKIN SOCIETY OF BIRMINGHAM.—Mr. Lionel Cust, M.A., on "Portraits as Historical Documents," 8 p.m.

GEOLOGICAL SOCIETY OF LONDON.—Meeting at 8 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Mr. James Bruce on "Recent Data concerning Concrete Beams and Concrete Floors," 7.30 p.m.

* Accepted.

CONTRACTS OPEN.

ROMFORD RURAL DISTRICT COUNCIL.
TO BUILDERS AND CONTRACTORS.

The above Council are prepared to receive TENDERS for the LAYING-OUT and FENCING of a CEMETERY at Upminster, and the ERECTION of a CHAPEL, &c., in connection therewith.

Plans, specifications, and conditions may be seen at the office of the Architect, Mr. E. M. WHITAKER, 1 Gresham Buildings, Basinghall Street, London, E.C., between the hours of TEN a.m. and FOUR p.m., except on Saturdays.

Bills of quantities can be obtained from the Architect on payment of Two Guineas, which will be returned on receipt of a bonâ-fide tender.

Tenders under seal, endorsed "Tenders for Laying-out Cemetery," must be delivered at my Office not later than FOUR p.m. on MONDAY, the 21st day of JANUARY next.

The Council do not bind themselves to accept the lowest or any Tender.

By order,
WILLIAM SMITH,
Clerk.

North Street, Romford,
December 31st, 1900.

SOUTHWICK SCHOOL BOARD.
TO BUILDERS AND CONTRACTORS.

The Southwick School Board invite TENDERS from competent contractors for Extensive ADDITIONS to the BOARD SCHOOL at Southwick, providing for an additional 245 children, in accordance with plans prepared by their Architects, Messrs. CLAYTON & BLACK, 152 North Street, Brighton.

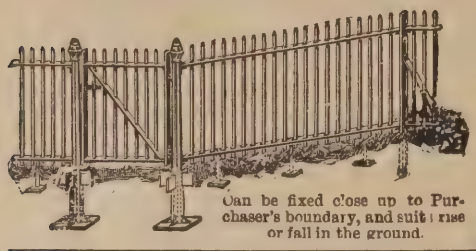
Builders willing to Tender are invited to send their names to Messrs. CLAYTON & BLACK, together with a deposit of £1 1s., to be returned on receipt of a bonâ-fide Tender; and bils of quantities will in due course be forwarded.

Tenders will be required to be sent to me on a form which will be supplied on or before the 30th inst.

The Board do not bind themselves to accept the lowest or any Tender.

By order,
JOHN BOYLING,
Clerk to the Board.

Southwick, near Brighton.



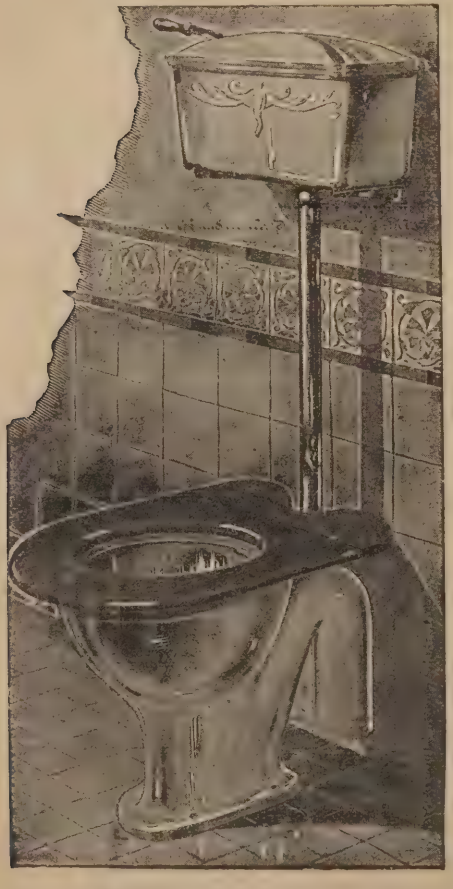
WATFORD ENDOWED SCHOOLS.
TO BUILDERS AND CONTRACTORS.

The Governors of the Watford Endowed Schools invite TENDERS for the ERECTION of a NEW LECTURE ROOM, &c., at the Schools, Derby Road, Watford, according to plans and specification prepared by Mr. C. P. Ayres, of Burvale, Watford, Architects, from whom full particulars, copies of the bills of quantities, and form of Tender can be obtained on payment of Two Guineas, which sum will be returned upon receipt of a bonâ-fide Tender.

The Governors do not bind themselves to accept the lowest or any Tender.

H. MORTEN TURNER,
Clerk to the Governors.

Watford Place, Watford.
January 1901.



Can be fixed close up to Purchaser's boundary, and suit rise or fall in the ground.

JANUARY 23, 1901. No. CCCXI.

HEPPINGHAM HOUSE, ARUNDEL STREET, STRAND, W.C.

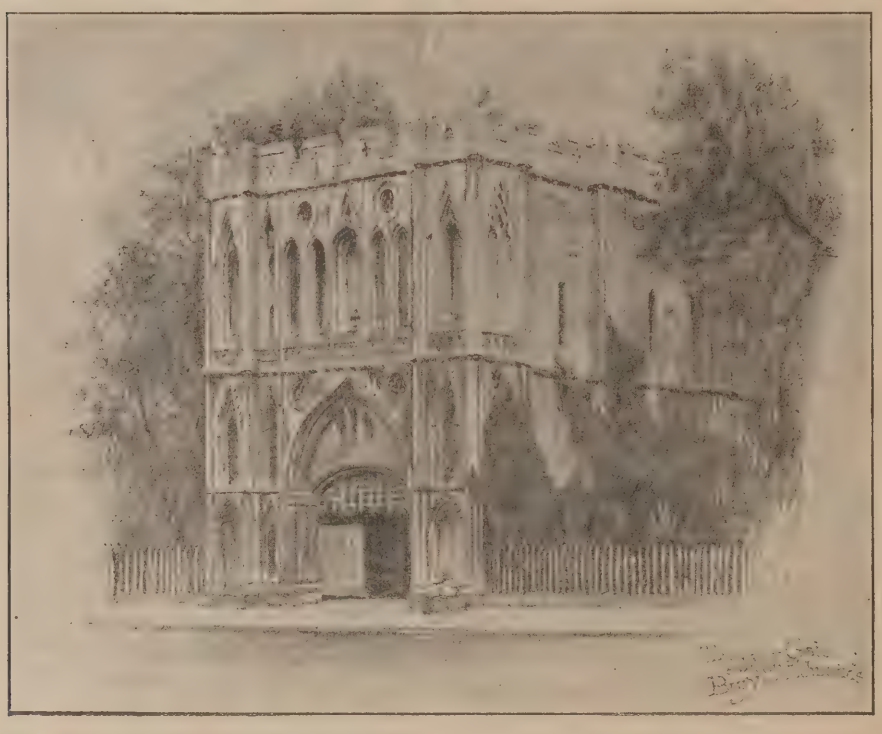
An Architectural Causerie.

Macadam Roads. WE have not yet arrived at that perfection which would enable us to call road-making an exact science. But in regard to macadam roads in particular there is not such diversity of opinion as that which at present characterises the subject of heating and ventilation, because Macadam himself laid down rules which, if intelligently observed, will result in a good road being formed. In a city like London, however, with its vast amount of incessant traffic, the problem is made most complex, and up to the present time no entirely satisfactory solution has been found. The paving which comes nearest to perfection is, perhaps, asphalt, because it wears well and is non-absorptive; but with a little rain it becomes exceedingly greasy and, consequently, is then dangerous to horses, though it must be admitted that this defect could be largely remedied if systematic washing with water were practised. Wood, both hard and soft, has not this disadvantage, but it is much less sanitary. Cobbles are altogether too noisy. Lastly, there is macadam. It cannot be said that the roads in London made in this manner are satisfactory. Take the Victoria Embankment, for example, upon which so much money has been spent with such indifferent results. The common practice when forming a new surface is to lay down cartloads of machine-crushed granite, to level with heavy steam rollers, and to cover the whole with "hoggin" of some friable material. More rolling, with watering, is then performed until the surface looks solid and attractive. Such a road gives little trouble when the weather is fine, but as soon as the rain comes it washes under the thin crust and gets into the interstices, so that the stones (which were never properly consolidated) become displaced and the road is made into a bad condition. It is of course assumed that all this while a heavy traffic is passing over the road, the knife-like rims of the 'bus wheels and the hammering of the horses' feet having a very different effect to the steam rollers, with their great wide wheels. It is interesting to note Macadam's own opinion as to the size of stones to be used. He says: "The size of stones for a road has been described in contracts in several different ways, sometimes as the size of a hen's egg, sometimes at half a pound weight. These descriptions are very vague, the first being an indefinite size, and the latter depending on the density of the stone used. . . . The size of stone used on a road must be in due proportion to the space occupied by a wheel of ordinary dimensions on a smooth level surface; this point of contact will be found to be, longitudinally, about an inch, and every piece of stone put into a road which exceeds an inch in any of its dimensions is mischievous." (Remarks on the present system of road-making, eighth edition, 1824, page 35.) But it does not appear that macadam roads, however well made, can withstand the enormous wear and tear of a traffic like that which daily fills the London streets. Asphalt and wood offer more advantages, and, as has already been stated in these columns, the Embankment will never be satisfactory till one of these pavings—or something similar—is laid down. The expense would, of course, be very great, but the money would be expended in a better manner than it is at present—for the continual repair of a road which is never satisfactory in wet weather.

A Good Exhibition. THE exhibition of specimens of modern illustration now open in the Indian Section of Victoria and Albert Museum, Imperial Institute Road, is well worth visiting. It has been organised by the Board of Education in collaboration with the Society of Arts, and may be considered as a sequel to the Exhibition of Lithographs held at the South Kensington Museum two years ago. It was decided to restrict it to typographic work suitable for book, magazine and newspaper illustration, the term "modern" including all work of this class executed since "the sixties," when there was such an outburst of fine illustrative design: moreover, it is since 1860 that photography has been available for reproductive purposes and "process" has come into being. Without going into the history of reproduction, it is perhaps opportune to point out that in the palmy days of wood-engraving the artist drew on the block (or his drawing was transferred to it) and the lines were cut by the engravers, for, as an economy of time, the block was generally divided into many pieces so that several engravers might work at the same time on the drawing. By the present photographic methods an absolute facsimile of the original drawing is obtained on metal, and though the value of the line is not quite equal to that obtained from a wood block it is nevertheless possible to see the artist's original work, not the wood-engraver's interpretation of it. That in many cases the drawing lost considerably by this interpretation is apparent from the examples shown at this exhibition, and it is almost pathetic to see how Millais scribbled notes to the engraver over the proofs of some of his illustrations. Rossetti was much displeased with results when working for Dalziel's illustrated "Tennyson." He wrote: "I have designed five blocks for 'Tennyson,' save seven which are still cutting and maiming. It is a thankless task. After a fortnight's work my block goes to the engraver, like Agag delicately, and is hewn in pieces before the Lord Harry." He adds these lines:—

"O, woodman, spare that block,
O, gash not anyhow!
It took ten days by clock,
I'd fain protect it now.
Chorus—Wild laughter from Dalziel's workshop."

It is hardly within our province to deal at any length with the purely pictorial or decorative drawings which constitute the main portion of this exhibition, but even the architectural student can study these, for there is much to learn, both in technique and design, and much to admire. Many "fragments" of architecture are to be found among these drawings; for example, in Sir Edward Poynter's "Joseph before Pharaoh" we have a clever rendering of part of an Egyptian hall, with the lotus capitals and the mystic decorations, while a portion of a gabled house is to be found among the work of Mr. Alfred Parsons, whose flower and tree studies are so exquisite. Notice should also be taken of Daniel Vierge's "Plasterers at Work" (No. 1322): Vierge is a mastsr who has influenced modern illustration very considerably. Another interesting exhibit is the engraving of John Ruskin by H. S. Uhlrich. It shows the great writer in the prime of life (he was then clean shaven) and it met with his approval, for he wrote to the artist in July, 1879: "The portrait of me is out and out the best done." The architectural draughtsmen are represented by Joseph Pennell, Hedley Fitton, John Ruskin, Herbert Railton, Henry C. Brewer, F. G. Kitton, Edmund H. New, F. L. B. Griggs, H. P. Clifford, Frank L. Emanuel, Ernest Peixotto, C. Gerald Horsley, Philip Norman, F. Hamilton Jackson and Holland Tringham; many of the drawings exhibited have been illustrated in "The Architectural Review" and in our own columns. The drawings by Mr. Brewer and Mr. Pennell are specially notable; the illustrations to "The Romance of Spain" by the former include a fine view of Gerona (No. 1238), showing a skilful treatment of light and shade, and a beautiful interior of Toledo Cathedral (1239) with shafts of lights striking through the clerestory windows. Of Mr. Pennell's drawings those of the Stationers' and Brewers' Halls (1551 and 1560), Laon Cathedral (western doorway, 1558) and Le Puy En Velay (1552—which he considers to be the most beautiful spot in the world) are specially worthy of note. Mr. Fitton, unlike Mr. Railton, is not at all well represented, and we miss the work of several other architectural draughtsmen, such as Mr. Norman Shaw, Mr. C. E. Mallows and Mr. W. R. Lethaby—and Martin Rico. But, as a whole, the exhibition is an excellent one, and the organisers are to be congratulated on the success of their enterprise.



QUEEN'S HEAD, GREAT CLACTON. DRAWN BY HENRY T. REES.

Queen's Head, Great Clacton. THE drawing shown on this page of the Queen's Head at Great Clacton, by Mr. Henry T. Rees, is a striking example of the fact that "old times are changed, old manners gone," for this one-time busy hostelry has outlived its day and its extensive outbuildings and stabling accommodation are out of keeping with modern requirements. It is only for a brief season of the year that the advent of the cyclist restores to it some semblance of its former glory, when the toot of the horn announced the arrival of the mail coach and all was life and bustle within.

BURY ST. EDMUNDS.

BY EDWARD WALKER.

IF during the pursuit of his studies the architectural student, following upon a sojourn at Ipswich and that inevitable acquaintance with its foundries, its busy quayside and busier streets, should visit the town of Bury St. Edmunds, it will be to experience a sense of relief on observing the quiet old-world air of the place; and should he go there with the object of making some additions to his sketch-book he will especially regard with satisfaction the almost deserted streets. Such, at least, was the experience of the writer. He should not however be too sanguine, for if he expects to find in Bury St. Edmunds specimens of domestic architecture equal to the beautiful work of that character to be seen at Ipswich, he will probably be a little disappointed at the comparative fruitlessness of his search; but only let him visit the spot where once stood St. Edmund's ancient abbey, that grand old monument of ecclesiastical architecture, and one would fain watch the change produced in him by the Abbey Gate and Norman Tower of the combination of strong fortress and ornamental gatehouse—images concealing the oylettes, and the stations for the archers being entirely hidden both from the outside and from persons entering the gateway. The principal room, 28ft. square, was lighted by a large window to the east, and by two smaller ones on either side. From the large east window, the elegant tracery of which is still well preserved, and looking into the Abbey grounds, a most enchanting and interesting view must have been possible. In the foreground would appear the court and palace of the abbot, with the magnificent pile of monastic buildings rising behind; then the beautiful gardens and vineyard; and between, the rivers Lark and Linnet winding through a fertile valley and uniting their waters under the picturesque bridge (still existing) at the extremity of the Abbey grounds. A drawing of the western front of the Abbey Gate is given on this page. The Norman Tower, which is also illustrated (see page 472), is the work of Abbot Anselm, and was erected by him as the principal entrance to the cemetery of St. Edmund about the year 1125. Though, doubtless, somewhat heavy, its architecture is yet simple and dignified, well befitting its character as the gateway to a

DRAWN BY EDWARD WALKER.

and the two churches of St. Mary and St. James.

It is true that the traces of the Abbey itself are little more than huge grass-grown mounds and heaps of stones, yet even these, shapeless though they be, are of the greatest interest to the painstaking student, as they enable him to follow step by step the general planning, and thus to form some idea of what the edifice must have been before the work of demolition commenced. Fortunately the Abbey Gate and Norman Tower are in a remarkably perfect state of preservation. The first-named was formerly the main entrance to the Abbey, and is, perhaps, one of the finest examples of Decorated architecture in the Kingdom. Erected about the year 1347, after the destruction of a previous gateway, it is 41ft. wide and 62ft. high, being richly ornamented with exquisite tracery and crocketted arcading, while the details of the carved strings, capitals and mouldings are as beautifully wrought and pure in style as, surely, it is possible for them to be. In the south-west and north-west angles were staircases, and one of these remains, giving access to the battlements. The entrance to either staircase is within the inner area, so that access to the gallery might be obtained even when an enemy had forced the portcullis. The whole structure is a very curious example burial ground. The accompanying illustration shows the east front facing into the cemetery, but the corresponding large semicircular arch of the western façade is carved with chevrons and other elaborate Norman enrichments in its receding planes, and is altogether a remarkably fine example. The tympanum of the great arch was originally filled with symbolic sculptures, but these were removed in 1789 to afford freer access for loads of hay and straw, the tower at that time doing duty as a storehouse for such commodities.

Close to the Norman Tower and the ruins of the Abbey are the two churches of St. Mary and St. James. The former, a large Perpendicular structure with a nave 140ft. in length, is covered by an open timber roof of such beauty of design and exquisite workmanship as to cause it to be considered—and by those eminently qualified to judge—one of the most beautiful hammer-beam roofs remaining in the whole country. The exterior of the church, though of good design throughout, has nothing of remarkable interest, with one justly-famous exception—the north porch, also known as the "Notyngham porch." A drawing of the side of this porch is shown on page 470, but this, it is feared, can convey but a slight idea of the extreme beauty of this truly superb and wonderfully-complete example of the richest, possibly the best, period of English Gothic architecture. Of a similar period, St. James' church is equally interesting, and, with the exception of the Notyngham porch, quite as fine as St. Mary's.

Although, as already remarked, there are considerably fewer relics of domestic architecture at Bury St. Edmunds than at Ipswich, yet one or two houses in the former town are worthy of attention, notably the ancient building known as Moyse's Hall, a curious specimen of an early Norman dwelling-house; and the "Cupola House" dated 1693, a picturesque building, the quaint skyline of which is here illustrated. Among the public buildings should be mentioned the Town Hall, by Robert Adam, the abler of the famous Brothers Adam, and the Guildhall, which latter, though re-fronted in 1807, possesses a good fifteenth-century porch and a well-preserved and finely-moulded Early English arch.

THE PLANNING OF SMALL COUNTRY HOUSES.*

BY M. H. BAILLIE SCOTT.

IT would be difficult to overestimate the practical importance of the subject of this paper—"The Planning of Small Country Houses." We most of us live in small houses and depend for our daily comfort and well-being, to no small extent, on the amount of skill displayed in their design, and yet in the majority of cases the small house presents but little evidence of careful planning—a bay window and some leaded glass in the front door are held to be more than sufficient substitutes for solid and less obvious advantages.

Let us consider for a moment a practical example and let us imagine a man who, in the language of the advertisements, may be described as a tired brain-worker, seated in his study in the throes of literary composition, or steeping his weary brain in the purple pages of modern fiction. Over his head the children of his family are beating a tattoo, to which the chandelier jumps in unison. From the kitchen unutterable odours exude and rancorous voices engage in laughter or wrangle. Let us follow him to the dining-room, which is apparently all table and sideboard, or edge our way past the hat-stand and so into the drawing-room, where the milking-stools and painted tambourines are and where occasional tables hardly seem to justify even such a limited demand on their services as their name implies. A few simple rules suggest themselves at once as remedies to these defects in his surroundings. The children's room need not be arranged to come over the study, the floors generally should be deafened and fairly solid walls should divide the kitchen premises. Then the kitchen should have good ventilation and, finally, most of the furniture should be ejected.

As a contrast to such a house and as a guide to better things, I can perhaps hardly do better than quote a few lines from the "Eagle's Nest," which suggests a somewhat different picture:—"And in actual life let me assure you in conclusion the first wisdom of calm is to plan and resolve to labour for the comfort and beauty of a house, such as, if we could obtain it, we would quit no more. Not a compartment of a model lodging-house, not the number so-and-so of Paradise Row, but a cottage all of our own, with its little garden, its pleasant view, its surrounding fields, its neighbouring stream, its healthy air and clean kitchen, parlour and bedrooms."

It is very useful to keep such a picture before one, because it suggests nothing "artistic" in the ordinary sense. One may cheerfully dispense with the half-timber work, barge boards, finials and the rest, and be content to rely on quiet and restrained building and simply-proportioned masses. The walls should be as thick as may be, the windows small and few, the roof simple and low, and all the external materials such as Nature will deal kindly with. Inside one recognises the value of whitewash and scrubbed wood, of low rooms

* A paper read before the Liverpool Architectural Society on January 7th, 1901.

with little furniture and fewer ornaments. There is no influx of the cabinet-maker's shop and if there are few things of great artistic value at least there is nothing which is vulgar.

In presenting to your notice what may be described as a "fancy plan," a cottage if not a castle in the air, I feel it necessary to anticipate the criticism of the practical man, who declares that, inasmuch as each house presents a special problem and represents the particular requirements of a particular client, it is idle to design except to order. With all the varieties of individual requirement it will be found, however, that the fundamental requirements of the average family are still the same. We all like light and sunny rooms and we all appreciate planning which results in substantial comforts as well as beauty and economy. We all require places for dining, for sleeping and for talking in, and in the large majority of families these requirements are practically identical. I had thought this particular plan might be the more interesting to you if, besides illustrating various features in the small house which are considered in connection with this paper, it should also be modified to make

An Architect's House;

that is, a house particularly adapted for the requirements of an architect who works at home.

In will be well to remember at the outset that in planning a house one is providing accommodation for what we may call two distinct communities, the family and the servants. Then again the family itself may be divided into adults and children, and besides these there are the visitors to be considered, though perhaps not to the extent which leads us to describe our rooms as reception rooms.

Having first secured in the plan due privacy as between the family and the servants, one is led to consider the habits of the members of the family itself as a further basis for planning. One realises that the evolution of the modern house has led to the development of special cells for special functions, and that in the limited space at one's disposal in planning a small house this sub-division has resulted in extremely cramped conditions, so that the house consists of a series of small rectangular boxes, each filled to overflowing with cumbrous and useless furniture. In one's own conception of a small house one realises the necessity for one room, call it hall or living room, which shall be a meeting-place for the members of the family. This room at least should be of reasonable size, and should have the best aspect and prospects available. It may be broad and low in proportion, or it may be made two storeys high. It should never be a passage-way to other rooms, and its furnishing should be of the scantiest; broad, wide floor spaces are better than a house full of cabinets and knick-knacks.

It will next be necessary to provide special retreats for each member of the family grouped round this central room—the ladies' bower, the man's study or den, and the children's room, and inasmuch as it is not desirable that the general sitting-room should be used for meals, a special cell develops itself for this function, and adjoining this are the kitchen premises, while the upper floor provides the necessary bedrooms and bathroom.

The Hall

In considering the hall one is led back to the time when the house consisted of one simple primary cell, and that cell the hall or house-place. Gradually, as the house developed and special cells became necessary for special requirements, the hall itself began to dwindle and became absorbed in its dependencies, which usurped its functions. Its occupation, its uses, were gone, and though it persisted in the larger houses, in those which were necessarily planned under economic conditions it dwindled down to the lobby. And so the modern revival of the hall in the small country house has not altogether been a success. It is a passage for servants and visitors, a sitting-room where no one sits, and from the economic point of view a room wasted for mere effect. And yet one cannot but feel that this central sitting-room is still the best expression of the family life of to-day, and its introduction is more than justified if one can arrange that it shall not be a passage-way to the other rooms. The plans before you (see centre plates of this issue) will show how this has been done in one or two examples. In the house at Knutsford, for instance, the hall is used as the principal sitting-room, and there is nothing to disturb its privacy and comfort; this plan is given as a practical working example of what may possibly be considered as a mere theory.

It has been objected to such a restriction of the uses of the hall that when it ceases to be a passage it ceases also to be a hall, and becomes merely a sitting-room—a parlour if you like. But the real characteristic of the hall, which differentiates it from the sitting-rooms, is that it is the room from which the other rooms in the house open, the focus and nucleus of the plan.

In a house where the ceilings of the sitting-rooms are low, it affords a pleasant change to have the height of the hall running through the two storeys. When this is done, however, it is desirable not to indulge too much in open galleries, and to fit any upper openings with leaded glass or shutters. This secures the privacy of the hall and helps to prevent draughts. When the site and other local conditions permit it, I always prefer to place the hall on the sunny side of the house, with sitting-rooms to the right and left—to make it indeed the centre of a row of rooms, all of which have a southern aspect. This means a long house rather than a square one, and although the latter may be more compact and possibly warmer, these advantages will hardly compensate for the sunless hall. Such arrangements will, of course, be modified when there are special views to be considered, although when it is a question between sun and view I should be inclined to choose the former, though in most cases it is possible to secure both.

The Dining-room.

The functions of the dining-room in the small house are not so limited as its name would imply. It is a room set apart for meals, and, though beyond this, it often becomes a sitting-room, this use cannot be recommended, as it is hardly desirable to spend one's evenings encompassed by the lingering odours of the table. In the small house, however, a separate room set apart for only such occasional use appears somewhat a waste of space, and so I have shown how a dining recess can be arranged as a kind of adjunct to the hall, an arrangement which, besides meeting the practical problem, is also, I venture to think, eminently picturesque in character and probably preferable to the small rectangular box which necessarily constitutes the ordinary dining-room in the small house.

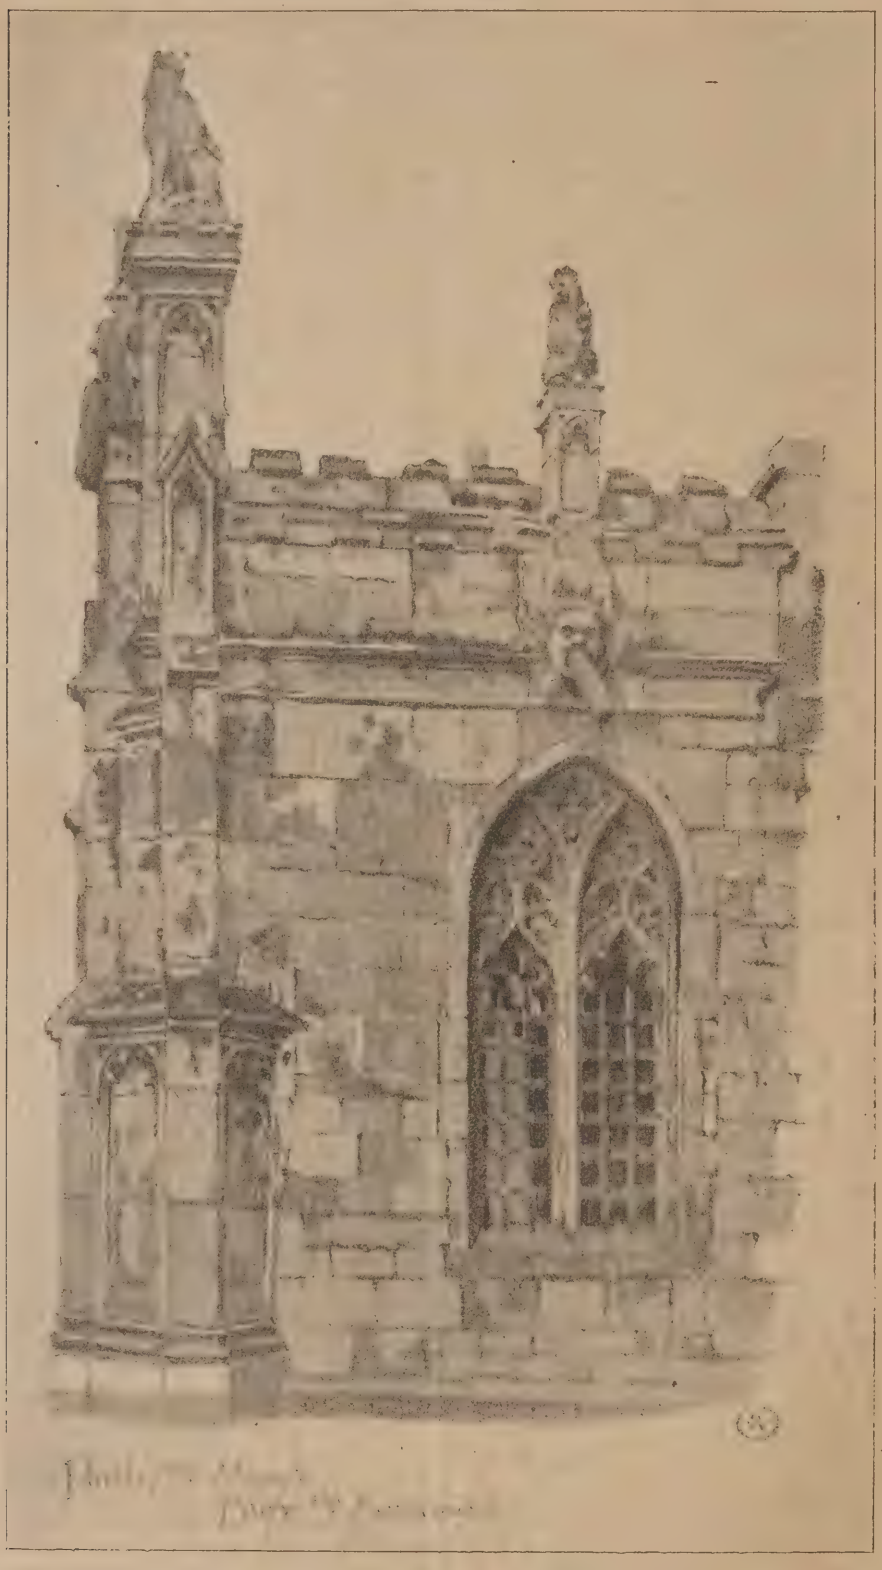
A glance at the plan will show how such a recess admits of service from the kitchen without disturbing the privacy of the hall, and in one's general aim to bring back to the modern house, so dull and so prosaic, some of that spirit of the true romance which inspired the houses of our forefathers, one must count as really helpful this arrangement of the dining table. The outcome of practical and economical requirements, it is yet capable of treatment which will lend an added beauty to the hall. The curtains which screen the recess may be perhaps of reddish brown and decorated with some broad and simple design in appliqué embroidery, and when these are drawn back one becomes aware of a table set with few and dainty appointments relieved against a dark background of seats, the whole picture glowing in the soft suffused light of candles. Such a picture certainly runs counter to all conventional ideas, and so already I find myself to have so far overstepped the province of a mere architect as to try and criticise and amend the customs of the dweller in the small house and to set up an ideal for him and his family, not the foolish aping of the customs of the "rich and great," but a simple ritual of daily life, which, admitting in its service nothing that is ugly, nothing that is without some individual beauty, be it only a knife or spoon, will among other things help us to recognise the innate vulgarity of that survival of barbarism which finds its modern expression in elaborate menus and gorgeous flunkeys.

Drawing-room.

The drawing-room, or ladies' room, should obviously bear in its character a feminine relation to the hall. As an adjunct to the hall, its dainty whiteness is a welcome note, and it is at least helpful to the designer if the room is described as the bower, as it helps to remove one a step further from the drawing-room as one remembers it in a hundred modern homes. A long heritage of misdoing in the way of furnishing makes it indeed almost a foregone conclusion that the drawing-room will not be a success. It is written that one should be haunted there by innumerable photographs and surrounded by precarious tables set with books and albums and a hundred knick-knacks. These things, it would appear, are part of the eternal feminine in her modern manifestations, and without such pitfalls and such distracting trifles she would probably pine away. And so we suffer them gladly, and in our artistic endeavours we learn to place the drawing-room among the might-have-beens.

And yet the drawing-room is capable of such gracefulness and elegance of treatment that in spite of its ultimate furnishings one hopes to influence it for good to some extent. It may appear fanciful to the practical person, but I must confess here to a habit of taking some appropriate line of poetry as a suggestion and inspiration for a scheme of decoration. In a drawing-room recently executed such an inspiration was provided by a line from a beautiful ballad by George Meredith, and "A frost of beauty white" helped to suggest a room with delicately-moulded white panelling, modelled plaster frieze and ceiling, where the foliage of oak and ash and hawthorn are untouched with colour, and a forest of tapered shafts is disposed in varied grouping round the room, bearing capitals of carved leafage and fruit.

The Nursery.



The nursery will probably be subjected to harder wear than any other room in the house, and should be finished accordingly. A dado of matchboarding (which need not be of equal narrow widths, with neat V-joints) will probably be the best treatment for the lower part of the walls, and it will be an advantage if one can take the ceiling partly into the roof, so that a beam may perhaps be introduced for a swing. Those who believe in the unconscious influence of habitual surroundings on children will recognise the necessity for a picturesque and cheerful treatment of this room, and those who value quiet will appreciate the desirability of due attention being given to the placing of the nursery.

The Kitchen.

It is rather curious to consider that modern inspiration in furnishing has largely been

obtained from the kitchen. Nor is this to be wondered at, because as the furnishing and decoration of the reception rooms of the house became more and more influenced by the dictates of fashion and the desire for a showy effect, in the natural reaction which followed one turned with relief to the one room in the house where everything was made for use. And so by slow degrees the kitchen furniture began to invade the rest of the house. The simple table with its scrubbed deal top, the rush-bottomed chairs, the dresser with its rows of plates and brass candlesticks from the mantel; all these things were found to be better in the small house than all the old imitation splendours. And so in considering the kitchen in the kind of house we are discussing there is not much to differentiate it from the other rooms.

The best treatment of the walls, when price will allow, is probably white glazed tiles, or the red brick wall may be left visible above a dado of matchboard, with red tiles for the floor. It is most essential to provide good ventilation, for which a special shaft should be formed. The window should be so placed that there is a good side light on the range, and the position of the kitchen with relation to the other rooms should be carefully adjusted to avoid the penetration of sound or smell and yet allow of convenient service.

DRAWN BY EDWARD WALKER.

Bedrooms.

With regard to the bedrooms, it is perhaps hardly necessary to insist that their planning should merely be the outcome of ground-floor arrangements. While the plans are yet in their fluent sketch condition there will be many changes to bring the ground floor and first floor into harmony. In planning the bedrooms it must also be remembered that a bedroom is often a sick room, and so, for instance, it should be capable of being easily heated and should be so arranged that the bed can be placed preferably against an inside wall and in a position free from draughts. It is often possible to take the ceiling of the bedroom partly into the roof, and this arrangement adds interest to the room, while a beautiful room may be made by using a barrel-ceiling with intersecting bonnel-heads for the windows. If attic bedrooms are used it is desirable that the roofs should be boarded and felted. Such rooms may well be finished with fitments, which may be reasonably introduced under such conditions. In the ordinary bedrooms of rectangular plan fitments appear out of place. This incrustation of furniture suggests the influence of some centrifugal force which has flung all the ordinary movable articles of furniture against the walls and stuck them there.

Sanitary Fittings.

The sanitary fittings of the house will depend very much on what one is disposed to spend. On referring to our numerous catalogues one cannot but be impressed by the great amount of art displayed in the illustration of these sanitary articles, one feels that here indeed the commercial artist has realised the apotheosis of his genius, and one is led to wish that he would confine his entire attention to these matters and find his highest aspirations satisfied by the evolution of a scheme in three colours for a flush-down Simplicitas with cistern complete. Those who do not appreciate his efforts will, however, probably choose their sanitary wares for their practical advantages, and will prefer them in plain white ware. The position of the bathroom in the house should be fixed with due regard to simplicity and economy of plumbing, and in view of possible leakages it will be best to place it over that part of the ground-floor plan which will be least damaged by an overflow. The copper cylinder for the hot water may often be placed in the linen closet.

Staircase.

The staircase of the small house suggests many opportunities for treatment. It should of course be, like everything else, in scale with the house; and an artist with a feeling for the due limitations and capabilities of his materials will not probably wreath and ramp the handrail.

With regard to the position of the staircase, in the absence of a separate servants' staircase it should be so placed that it may be used by both family and servants without disturbing the privacy of the house; it should not, for instance, open off a hall which may be used as a sitting-room. In the treatment of newel posts and handrail my own particular preference is for close boarding instead of balusters, with some simple piercings, and quite a plain handrail as a capping, the newel posts being slightly tapered perhaps, or, when possible, run up to the ceiling. A finishing touch to such a scheme may be provided in the shape of carved brackets to the posts, and perhaps a piece of carved and pierced cresting to a level piece of handrail. In a little staircase to a house at Crowborough, in Sussex, such a scheme was carried out, the woodwork being stained green and each post having brackets to represent the branches, flowers and fruit of various trees, carved, gilded, and painted; and, without aiming at any mediæval effects, one gained something of the brightness and gaiety of their colour schemes. While speaking of staircases the curious significance of steps in design may be noted. A room at a low level with a few steps down to it gains an added cosiness for such an approach. It implies the primrose way. To step up to a room on a higher level gives one the impression of dignity—of approaching the presence. It is no empty symbolism which places the altars of our churches above the general floor level, and the dignity so gained is very real in its effect on the mind; and so in the cottage, even, it is well to remember this significance of steps, even though by so doing we thus provide occasional pitfalls for the stranger within our gates.

Windows.

With regard to windows, it may be taken as a good general working rule to have but one window in a room, and that one not too large. Those wise men who are responsible for the construction of modern building by-laws have invented curious and ingenious rules on this subject, but unfortunately no one is prevented from making their windows abnormally large, and every consideration is shown to that extraordinary superstition which impels the modern householder to demand large expanses of glass for the display of curtains, blinds and other dust-collecting furnishings. It should not be difficult for a reasonable man to understand that these large window spaces destroy altogether the comfort of a room, which becomes the more susceptible to every change in the external temperature, while the fact that the windows are generally shrouded in draperies shows that they are not required for light.

The windows proposed for the class of houses under consideration are casements opening outwards, with simple wooden mullions, the general proportions being long and low. The opening casements may be of wood and either cut out of the frame itself or form a separate frame. The frames need not be moulded, but an effective and comparatively economical window is made by moulding the mullions only and leaving the heads and sills plain. Iron casements of good sections are the most satisfactory in exposed positions, but are necessarily more expensive. Casement bars and fasteners will give an opportunity for some simple wrought ironwork by a local smith. If leaded glass is used it will be most practicable in fairly large squares, with ½in. leads; and here and there we may perhaps get a little bit of decorative work in colours. For furnishing, each window will require merely a serge curtain on a rod of brass or iron.

Height of Ceilings.

The height of the ceilings may well be considered as one of the root questions in designing a house. One generally finds that most architects realise the desirability and reasonableness of a low ceiling, while as to the general public one might almost construct a scale for measuring the intelligence and cultivation of a client based on his ideas on this subject. The man who loves a lofty ceiling is not a man of corresponding lofty intelligence. I am almost afraid, however, that I shall shock even you architects if I state without warning my own convictions as to the proper height for a ceiling.

If I were building a house for myself I should certainly not make the ceilings more than 7ft. 9in. high, and below this line would be the beams, perhaps 9in. by 6in. laid flat. And this ceiling-level thus happily fixed, all things will work together for good. The long low windows will finish, as they should do, at the ceiling-level without undue distortion and without a dark and dismal wall space above to deal with. The wall itself may be without picture rails or other devices for cutting it up horizontally, and so in its proportions it becomes at once a cottage wall, and not even an art wallpaper can quite obscure the cottage note.

And if the ceiling leads to such happy results inside, on the exterior also its influence may be noticed. Proportions become broad and low of themselves, and one is not prompted to introduce string courses and other features to palliate original defects in proportion. Economically the advantages of a low ceiling are too obvious to need more than passing notice here. For every foot of wall space given up one gains an increase in floor area, and not only is the actual size of our rooms so increased, but the room with a low ceiling always appears to be larger than it really is.

Doors.

The most satisfactory door for a small house is probably a ledged door with wrought-iron hinges and latch, and the ironwork will give plenty of scope for character and design. Panel doors present an endless variety of patterns and proportions, and the chief merit of the design adopted will depend on its harmony with its surroundings. Doors, like all other features of a house, cannot be satisfactorily designed as an independent composition. One has heard of the man who took round a brick as a sample of his house; he was perhaps wiser than we give him credit for, for every detail of a house should have its relations to the rest. It would perhaps be a good rule to remember that every door may mean a draught, and so to make as few doors as possible and place these so that at least the greater part of the rooms may be free from draught.

Fireplace Treatment.

The treatment of the fireplace is a subject which opens up a vista of possibilities, but for the sitting-rooms at least the great question will be whether to avoid risks and use the modern grate and put up with its mean and despicable appearance, or boldly adopt the open hearth with all the liberal and homely associations it suggests, and with the practical disadvantage of a possibility of smoke.

I have generally found a copper hood over an open grate to be the most satisfactory method, and with a little adjustment such a fire will not smoke. The fire then stands out on the hearth and is not tucked away in a hole in the wall, and the whole of the appearance of the fireside is infinitely more cheerful and inviting than the paltry modern grate, however prettily surrounded with tiles and mantels. For the bedrooms I have found the fire on the hearths the best, because a fire of this kind can be kept in all night if required without stoking.

Beams and Posts.

The importance and usefulness of the beam has been fully recognised in the small house. It should be cambered, and in most cases will look all the better for being roughly squared and chamfered with the adze. The use of the beam, however, naturally suggests the use of the post, and it seems a sound and reasonable thing that a beam of a long span should be supported by one or more intermediate posts, and these posts may well be arranged to come in such positions in a room that they will help rather than hinder the effect of its furnishing. The connection thus formed between floor and ceiling gives a distinct character to a room. It is no longer a rectangular box merely, and one derives an unconscious pleasure from the contemplation of the substantial and visible means of support thus afforded to the beams of our chambers. The little sketch before you (see centre plate) attempts to illustrate the effect of a post in a room, and incidentally shows the general character of a cottage interior.

The relation between a house and its site is a matter which requires careful consideration. It is well for the architect to pay no hurried visit to the ground he is about to make or mar, and a tour in the nighbourhood will help him to realise what is local and characteristic in the buildings. He will begin then to realise the genius of the country side, and his house when complete will not appear as an importation, but so far from being a blot on the landscape will seem to express its very spirit. As a practical example one may take the Windermere district, a district of slate and rough-cast walls. Bricks, half-timber, and tiled roofs, which fit so well into so many localities, stand out there as a glaring offence, and if one would propitiate the *genius loci* one must build with the slate of the district.

When one has realised this local quality and the possibilities of the local materials it is time to make a sketch plan and this should be kept in a simmering and fluent state for as long as possible. It should be modelled and remodelled till a satisfactory result has been attained.

When this is done one should not commit oneself to elevation but get inside the house at an early stage, making a section for instance showing the main broad facts of roof and floors; and then the rooms; drawing, say, to ¼in. scale, the elevation of their sides showing the position of the windows and fireplaces. Then we may follow with elevation, and there will probably be some give and take, some compromise between exterior and interior, but the true principle seems to me to design from the inside and let the exterior represent a record of the internal requirements. I have no sympathy with the system which obtains so widely nowadays of forcing the interior to fit the façade—and no imposing rows of columns will compensate for such obvious insincerity.

In making such drawings of the interiors I have found that the great pitfall for the designer lies in forgetting the point of view. In order to avoid mistakes which arise in this way, it is a good plan to draw an eye-line at a height of 5ft. and possibly another lower to represent the eye-line when seated; and besides this it is well to block out with charcoal on one's office wall the main features of the room so that one may realise the actual size and proportions of things. These precautions will save one from many unpleasant surprises.

To the man who would rather draw a thing than write about it the specification is necessarily rather a trial. It may be made much more interesting as well as useful if it is not considered so much a dry legal document as a real attempt on the architect's part to describe to the workman what he would have him do, and written entirely from this point of view we shall find it will more than fulfill the necessary legal qualifications.

With regard to materials, it has already been pointed out that they should be as far as possible local. It is perhaps still more important that they should weather well, for Nature will then help us to correct our mistakes. Bricks should not be chosen for their evenness of colour or smoothness of surface. They should present the characteristic surface of burnt clay, and each year under the influence of the weather they should gain an added beauty. Rough-cast on stone or brick is perhaps the most satisfactory material for the exterior of the small house. It helps to make a dry wall, and it may be finished with colour-wash, either white or cream or a deep yellow or terra-cotta shade. Half-timber one has become to regard as a weakness of one's early years which is still not without its charm. To use it constructionally, however, means considerable expense and difficulty, for it should be built up of solid oak beams with here and there a natural curve in their outline, and the windows moulded in the solid framing with mason stops and projecting pegs and rows of little mullions with leaded glass. All these things are very fascinating, and in the right district and surroundings a half-timbered house carried out with the right feeling is almost unequalled in its effect. But nowadays it is a luxury, and the builder of a small house will be better advised to be content with plain wall spaces.

In a stone district, too, it is equally to be desired that one should use thick stone walls with stone-mullioned window and a stone roof, and inside as far as possible to carry out the same logical idea; but here again one cannot always afford in the small house to indulge in one's artistic aspirations, and so we are content to rough-cast our stone walls and make the window frames of painted wood.

The best material for the roof-covering will depend much on local conditions, but tiles or green slates may generally be said to be the best for a small house. Thatch, in spite of certain disadvantages, forms a very satisfactory roof-covering; it should not, however, be used on a roof which has been designed for slates or tiles. To make the most of its picturesque qualities it is always desirable to plan the house for such a roof. Its distinguishing characteristic is that one may introduce curved surfaces and lines instead of straight ones into the roof, and this characteristic opens up whole visions of picturesque possibilities.

In the woodwork of the interior of the small house one must be content with deal, which may be either painted or stained. For the larger timbers and beams and other constructional woodwork, which it is our aim as far as possible to leave visible, it is not desirable to have too high a finish, and the adze and the chisel are better tools for these at least than the plane. And I may mention in passing that I should not be sorry to see the plane banished from our workshops. It represents the thin edge of the wedge, the substitute of the machine for the tool which reduces everything to that dead level of monotony which we are taught to admire as the perfection of workmanship.

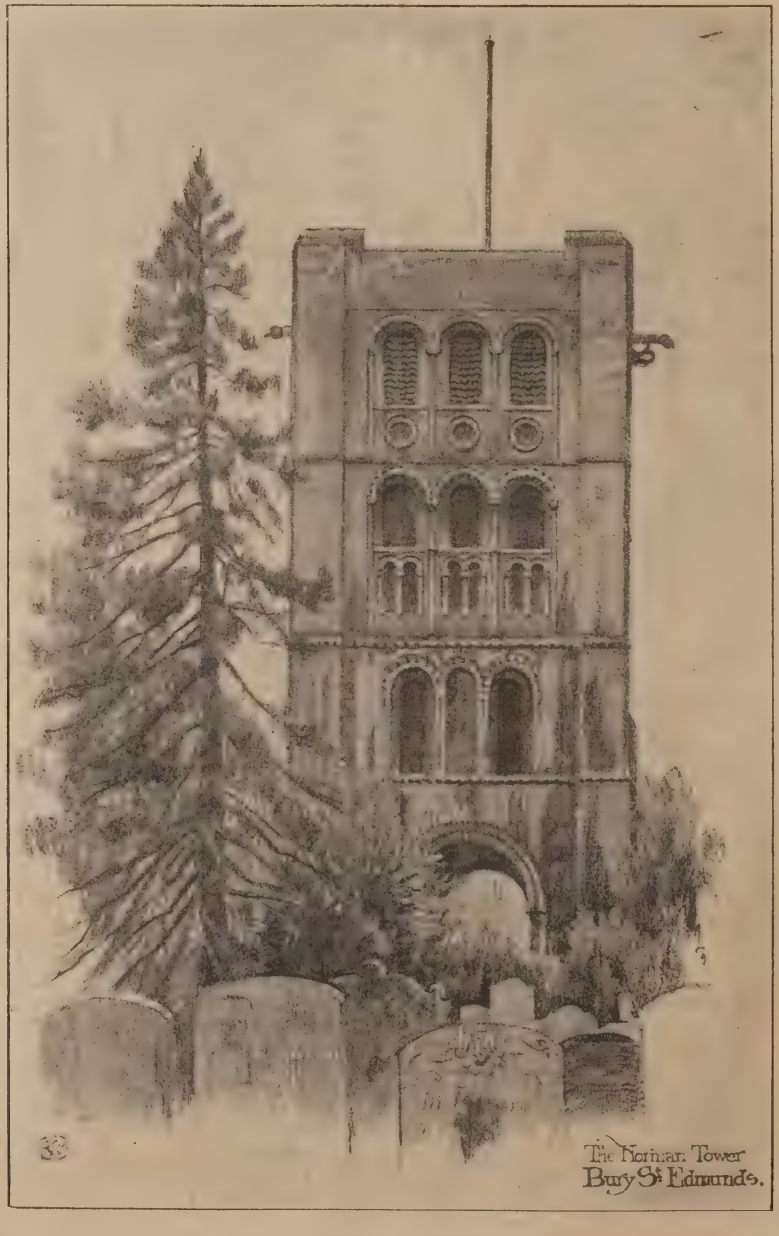
In the plastering of the walls and ceiling of the house one is again reminded of the same

ideal, and on all sides one is surrounded by surfaces which are level and monotonous. One feels that plaster should have, like every other material, its characteristic surface, a surface which tells us something of the nature of the material and the workman's tools; or in many cases plaster may be omitted altogether and the wall itself either left visible or finished with whitewash.

Semi-detached Houses.

Referring to the plans illustrated (see centre plate) that of a semi-detached house was for a somewhat limited site. The frontage to the road is to the north and the application of the unalterable rule which has been well expressed in the happy phrase "Queen Anne in front and Mary Anne at the back" would naturally lead one to a bay window to the road, and to relegate the sunny side to back yards, ashpits and other squalid details.

In the plan I have ventured to bring Mary Anne round to the road and thus to get to each house a little garden with a sunny aspect for the sitting-rooms, and with a window looking north from the parlour for those who must needs observe the passers-by. I have always considered the semi-detached house a somewhat unsatisfactory arrangement. The name itself is misleading. It should be *semi-attached* and it is the semi-attachment which constitutes its weak point. To be wholly attached, to be one of a row, one of the crowd, almost eliminates the individuality of neighbours, but to the semi-attached one's only neighbour is not to be ignored. From the artistic point of view, however, the semi-attached house has its advantages, as one can secure with greater ease a long and low effect, as shown in sketch illustrated.



The house at Knutsford is practically a reproduction, with some slight alterations, of a plan which was illustrated and described in the January number of the "Studio" for 1895. These alterations chiefly consisted in a rearrangement of the kitchen premises and the introduction of a little secret staircase which, opening from a panel in the jamb of the drawing-room window, gave access to the music gallery and also formed a private stair to the bedroom over the dining-room. This house was carried out internally with furnishings of old oak panelling, old doors and staircase, and all heavy timbers were finished with the adze.

The architect's house is given as an illustration of some of the principles of planning suggested in this paper. The hall with "bower" and dining recess is a substitution for what would otherwise be three small sitting-rooms. It is of course a compromise to meet economical conditions both of cost of building and cost of maintenance, and a house which had these three sitting-rooms as well as the office accommodation shown would necessarily be costly to build and require a large staff of servants to work.

In the drawing of the hall of this house the ingle and dining recesses are shown.

I think it was William Morris who said that all furniture was either made of sticks or planks and that he preferred the latter. The illustration of this hall suggests a plank treatment. There are no sticks, and the cabinet shown is constructed on the humble model of the packing-case with external ledges which are decorated with a carved band. The interior of this cabinet is painted and the insides of the doors decorated with bright stencilled patterns.

The detail drawing of part of a staircase shows a carved and pierced cresting and carved brackets. The general woodwork is stained green. The stems and branches are all gilded, and the birds painted white on a blue ground. The roses are crimson and the leaves green.

DRAWN BY EDWARD WALKER.

Quarry Notes.

A Memorial to the late Lord Russell of Killowen is to be placed over the grave of the late Lord Chief Justice in Epsom Cemetery, and is to take the form of an elaborately-worked granite enclosure wall, to enclose a space of 27ft. by 20ft., and rising to an average height of about 6ft. At the corners, centre and sides of the gateway are to be large pillars, weighing about one ton each. They are to be wrought square, and tapered and pointed, and on each face there is to be an ornamental band of interlaced runic work. The panels between the pillars are to be built up of four crosses of stone work, and will form a series of small arches set on a tapered base course, this being capped by a rounded coping course having an ornamental band of running work raised in sunk panel on both sides. The whole of the work is to be finely chiselled, and designed with an old Irish character. The materials composing the memorial have been obtained from quarries near the village of Killowen, where Lord Russell was born, and will be executed by a Newry firm.

The new Cemetery at East Bournemouth has just had the Roman Catholic burial ground defined by the erection of a large Calvary. Like the old Calvaries of Brittany, it is composed wholly of granite; not of the almost black variety so common in Finisterre and throughout the opposite coast of North-western France, but of the light grey kind quarried amongst the tors of wild Dartmoor, and, perhaps, the hardest and most lasting of all the various kinds of British granites. The steps stand upon a cairn of rough granite, and upon these rests a monolith over twelve feet high. The upper part of the latter takes the form of a wheeled cross of Celtic character, and upon its front face, carved in the round in the solid granite, is a sculptured statue of the crucified Christ. It was designed by Sir Francis L. J. Barrow, Bart., architect, of Sunny Glen, Boscombe. It has been made in its entirety, and placed *in situ* by Messrs. Henry Hems and Sons, of Exeter. Messrs. Hems have also just erected a memorial close by, also designed by the same architect. It consists of a sculptured representation of Christ crucified, raised in high relief upon a plain white marble cross.

Maine Slate Quarries.—In the days of the early settlers in Piscataquis county, in the United States of America, slabs of slate were used as hearthstones for the cabins, while smaller pieces were split thin and smoothed with crude tools for school slates. The industry has now reached large proportions, and employment is furnished to a large number of men, although comparatively not so large as in other industries, since most of the slate quarrying work is done by machinery. The slate turned out of the Brownville quarries is used mostly for roofing, being particularly adapted to this purpose. The slate from these quarries is soft and dark coloured, and the veins average an uncommon thickness. The excavations vary from 150ft. to 200ft. The Maine quarries manufacture slate into very many different designs of flagging, mantels, sinks, toilet stands, &c. The blocks are sawn and are then put under an immense plane and smoothed. The edges are moulded in the same way as wood, only more powerful machinery is required. It is noticeable that slate seems to have been the first stone to be quarried to any extent in New England. In old churchyards and chapels the tablets are entirely of slate. In Maine quarries a large number of Swedes and Welshmen are employed.

THE PLANNING OF INEBRIATE REFORMATORIES.—I.

BY GEORGE H. BIBBY.

(INTRODUCTORY.)

UNDER the clauses of the Inebriates Act, 1898, it has been provided that where a person is convicted on indictment of an offence punishable with imprisonment or penal servitude, if the court is satisfied from the evidence that the offence was committed under the influence of drink or that drunkenness was a contributing cause of the offence, and the offender admits that he is, or is found by the jury to be, a habitual drunkard, the court may, in addition to, or in substitution for, any other sentence, order that he be detained for a term not exceeding three years in any *State Inebriate Reformatory* or in any *Certified Inebriate Reformatory* the managers of which may be willing to receive him.

It is provided by section 3 of the above Act that the Secretary of State may establish inebriate reformatories (in this Act described as State Inebriate Reformatories), and for that purpose may, with the approval of the Treasury, acquire any land, or erect or acquire any building, or appropriate the whole or any part of any building vested in him or under his control; and any expenses incurred under this section are to be paid out of moneys provided by Parliament.

But under section 5 the Secretary of State, on the application of the council of any county or borough, or of any persons desirous of establishing an inebriate reformatory, may, if satisfied as to the fitness of the reformatory and of the persons proposing to maintain it, certify it as an inebriate reformatory, and thereupon, while the certificate is in force, the reformatory would be constituted as a certified inebriate reformatory within the meaning of the Act.

The Inebriates Act, 1898, applies to Scotland, and the Lord-Lieutenant of Ireland may also establish State inebriate reformatories, and for that purpose may, with the approval of the Treasury, either authorise the Prisons Board to acquire any land, or to erect or acquire any building, or appropriate the whole or any part of any building vested in or under the control of the Prisons Board, the expense incurred being paid out of moneys provided by Parliament; the Act also applies to Scotland and Ireland as respects certified inebriate reformatories; but although it has been in operation since January 1st, 1899, the work of erecting buildings for the detention of inebriates appears to have progressed but very little, and complaints have been made by magistrates and others of the great want of reformatory accommodation throughout the country.

The provision of suitable inebriate reformatories is very considerably retarded by the initial difficulty that there are few architects whose previous training and experience qualifies them to deal with a class of building hitherto not demanded. An inebriate reformatory must not be planned wholly upon the lines of a workhouse, prison, lunatic asylum, or hospital; yet some features of all such institutions as these may be incorporated with advantage in the plans and general arrangements.

If planned too much on the usual basis of a workhouse there would not be sufficient means for preventing the escape of patients, neither would there be the requisite means for continued observation of the inmates; if arranged after the manner of a prison many of the chief objects for the detention of inebriates would remain unprovided for, and it must be remembered that there needs to be some accommodation in the form of apartments for recreation that would be out of place in a prison, but which would be necessary where inebriates are under detention.

Neither would all the arrangements of ordinary lunatic asylums afford adequate provision for the accommodation of inebriates; these would not give the means of safe custody of the inmates, and although the mental condition of some inebriates (especially during the first weeks of their detention) may render them at times worse than ordinary lunatics, yet the conditions under which they are to be detained vary so greatly that special arrangements of the buildings in which they are to be treated must be arranged for; a building which has been planned by an architect thoroughly conversant with the arrangements of asylums, hospitals, prisons and workhouses would, probably, be more likely to meet the requirements for inebriates than any erection by an architect without such experience.

Attention has been already directed to the fact that public authorities desirous of exercising their powers under the Inebriates Act, 1898, are contending with great difficulties while deciding as to the character of institutions calculated to meet the requirements of their districts. This is only to be expected, as the buildings required are quite without precedents, and there is little knowledge or experience available, and we are quite without the advantage of existing buildings which could serve the purpose of patterns to be followed or which, by long use, had proved suitable for the requirements of a house of detention for inebriates.

I have before me a recent plan for a reformatory for fifty male inebriates which has been issued from the Home Office, but with the explanation that it does not in any respect profess to be a model plan, or to be designed to supply every possible requirement, but that it was given merely as a suggestion, "to be modified or not according to desire or at the dictation of experience."

This plan is most unsatisfactory in almost every respect—the dormitories are much too small, the day-room and dining-room accommodation is badly arranged, and the floor areas are insufficient, the allowances being less per inmate than would be approved for prisons, asylums, hospitals or workhouses; the general kitchen and offices are absurdly small, and the mess-room for attendants is badly placed and could only be approached through the kitchen; there is very little space given for store-rooms, the passages are badly lighted, and the means of escape from the upper floors are such as would not be accepted by any public authority having competent officials to advise them. The mortuary is placed in a little closet on the ground floor below the hospital building and in such a position that it would be very difficult to push a coffin into it. A laundry is provided (21′ 0″ × 20′ 0″) which would be quite insufficient for an institution containing 50 male inmates and their officials; this "laundry" is without drying-closets, ironing-room, sorting-room or other necessary adjuncts, and as the buildings are for males only it would appear that the laundry should be in such a position that the laundry-women need not have to enter the internal court or buildings which should be occupied by male inmates only. The chapel and library are placed on an upper floor, and the latter could only be approached by passing the communion rails in the chapel, and the means of escape from this portion for the congregation in the event of fire or panic is by means of a badly-placed staircase of non-fire-resisting construction. The medical superintendent's residence is undesirably placed on the first and second floors of the front building, the apartments being all very small and inconveniently arranged and quite unsuitable for the occupation of a professional man charged with the duties and responsibilities of managing such an institution as is shown on the plans. Yet there is in the scheme an outlined suggestion of a *general arrangement* that could be worked out advantageously if the details were amended, and for this reason I have included this plan amongst the illustrations to be given with this series of articles.

Mr. R. W. Branthwaite, inspector of inebriate reformatories, has directed attention to the fact that safe custody is a subject of paramount importance, and that the Secretary of State will require evidence that due arrangements have been provided to prevent the escape of inmates. The majority of patients will undoubtedly be amenable to discipline, but a certain percentage will require the strictest supervision, at any rate for some considerable period; as it is impossible to discriminate at sight between these characters, it becomes absolutely necessary to treat every inmate as if he or she would escape at the first available opportunity until otherwise proved by study of each individual case.

In the Home Office plan the building is so arranged that its inner court for exercise is fenced in chiefly by the various erections—all external labour on the property being arranged for under proper supervision; by this means the expense of fencing in the whole of the property would be avoided.

The Home Office view appears to be that the fencing in of the entire property with an unclimable boundary would either result in an undue restriction of area, or, on the other hand, necessitate great expense; also that perfect supervision would be almost impossible in the case of patients roaming at will over large areas: if safe custody measures consisted solely of a wall round the whole property, the only means of effectually controlling persons known to be contemplating escape would be confinement within the building itself, with consequent irksome restraint and no possibility of anything like adequate outdoor exercise.

Inebriate reformatories should always be on rising ground, so as to afford, amongst other advantages, facility for adequate drainage. The Home Office requirement of land is one acre for every ten males or twenty females, but, especially in the case of the former, where land is obtainable at low rates, it will be found a distinct advantage to calculate acreage on a more liberal standard to afford ample scope for outdoor employment, exercise and recreation. A reformatory should always be situated at some distance from great centres of population, but within easy reach of railway communication with the district it is intended for. Where selection is possible, preference ought to be given to fairly elevated positions, whilst the advantage to inmates of bright and generally pleasant surroundings should not be disregarded. Finally, the site should be selected with the view to its suitability for agricultural or market-gardening operations, and should be of a healthy character, having, preferably, a gravelly, chalky or rocky substratum.

The Home Office estimates the cost for building an inebriate reformatory to be £6,000 if to provide for fifty patients, and it is suggested that £500 would be sufficient to provide the necessary furniture; but I regard these figures as being much too low for the purpose of providing a substantially-complete institution. The sum for the building is only at the rate of £120 per patient, while a county lunatic asylum has cost from £300 to £400 or more per patient (where from 1,000 to 2,000 patients are provided for). I fail to perceive why there should be so great a difference in the cost per patient. This can only be accounted for by supposing that the accommodation for inebriates would be greatly (and unnecessarily) inferior to that generally provided for the insane. Within certain bounds, the larger the number to be provided for the less should the cost be per head; one reason for this being a reduction in the proportionate cost of the administration buildings; this is particularly noteworthy in the case of asylums, workhouses and large infirmaries, especially in those instances where extensive wards have been added to existing institutions *without a corresponding enlargement of the original administrative buildings.*

With regard to cost it is difficult, in the absence of sufficient data, to estimate what amount should be expended per patient upon the building. There is so very little to guide us until proper institutions have been erected and paid for. Further than this it remains to be discovered what the full effect of inebriates reformatories will be upon the inmates; the more lengthy the detention of the inebriates the greater must be the number of new institutions to be provided under the Act. Mr. Branthwaite states: "Inebriates have no parallel with any other class for which institutions are required, and it would be well to bear in mind that the large majority of patients after about a month's residence will be in perfect *physical* condition and fit to undertake any ordinary occupation; from a curative point of view organisation of regular labour is essential, and such labour ought to bear financial value in the interests of both patient and institution." But unless convenient and well-appointed buildings be erected for inebriates, with

suitable workshops and means of employment provided therein, the Inebriates Act, 1898, will assuredly fail in its purpose. Such buildings must necessarily be costly. The land to be attached to a reformatory for 50 patients must have an area of at least five acres, which, at the Home Office estimate, may cost £500; add to this the low estimate before mentioned of £6,000 for the building and £500 for the furniture, and the total for the 50 patients will be £7,000. For the purposes of the Inebriates Act, 1898, it is believed that the Local Government Board would probably permit councils to borrow money for the purchase of land, repayable in 30 years; for buildings, repayable in 30 years; and furniture in 10 years, the loans being raised at 3 or 3½ per cent.

The site for an inebriates reformatory should not be near to any nuisances, such as steam engines, shafts of mines, noisy trades, or offensive manufactures; neither should it be intersected by public roads or footpaths; it should be elevated, as respects the surrounding country, undulating in its surface, cheerful in its position, and having a general fall to the south or south-west. It is of the utmost importance that there should be a *constant and ample supply of wholesome water*, of which a careful chemical and bacteriological analysis should be made, as well to ascertain its fitness for the purposes of drinking and washing as to determine the proper materials for pipes and cisterns.

(To be continued.)

Engineering Notes.

Messrs. R. Waygood and Company, Ltd., have posted the preference dividends for the six months ending January 15th.

Institution of Mechanical Engineers.—The annual report for 1900 shows a membership of 3,165 (a net gain of 243 over the previous year) and a balance to the good of about £36,000.

An International Tramway Congress is to be held in London in 1902. About 300 representative engineers, directors and managers of tramways and light railways on the Continent and elsewhere will attend.

Successful Municipal Water-Supply.—The Dover municipal water-supply yielded a profit of £4,337 last year, equal to a sixpenny rate. The water is supplied to houses of £20 rating at 10s. a year, and in proportion.

Electric Light for Portsmouth Dockyard.—After very mature consideration the Admiralty have decided to introduce the electric light in Portsmouth Dockyard. At present the place is wretchedly lighted with gas lamps of the early Victorian pattern.

Bridge Competition, Sydney, N.S.W.—Mr. E. Cruttwell, of London, has been awarded the premium of £1,000 in the competition for a bridge to connect Sydney with the North Shore. The Board of Examiners do not, however, recommend any of the plans for adoption.

Electric Light for Edmonton.—At a meeting of owners and ratepayers held last week the proposal of the Edmonton District Council to join with four surrounding parishes in promoting a Bill for electricity generating stations was upheld. The scheme is expected to cost £400,000.

Bermondsey Electric-Lighting Scheme.—The Bermondsey Borough Council have accepted a tender of Messrs. Crompton and Co., amounting to £2,595, for the supply and erection of cast-iron lamp columns, lamps and fittings, switches, &c., for that part of the electric-lighting system in course of completion in Bermondsey, London, S.E.

Electric Trams on Denmark Hill, London, S.E.—The London County Council, having decided to run a service of electric trams on Denmark Hill, have also deemed it necessary to widen that thoroughfare. They have accordingly approached the Lambeth Borough Council with a view to securing from that body one-third of the total cost of the improvement.

"Pure Water for London" is the title of a little book by Mr. R. P. Whellock A.R.I.B.A., recently published by Messrs. Simpkin, Marshall and Co. The author proposes that pure water for drinking purposes only should be procured by sinking wells into the chalk or greensand beds of the London Basin, and supplied for that purpose by separate mains. The estimated cost of construction is £3,000,000 sterling. With regard to this matter of the London water-supply, Mr. Shaw-Lefevre is of opinion that the Council's scheme for putting the water-supply under public control will, sooner or later, when all the devices of procrastination are exhausted, prove to be the only possible one, and will be approved by Parliament.

The Underground: a Lesson from Budapest.—Last week Sir W. H. Preece and two directors of the Metropolitan and the Metropolitan District Railways left England for Budapest to enquire into the working of the Ganz system of electric railway traction as employed there. The directors of the two companies have had under consideration at least nine tenders for converting their lines from steam to electrical propulsion. All the tenders are understood to have presented many points of excellence, and that of Messrs. Ganz and Co., although not accepted, has been selected for further investigation on account of its cheapness and the many novel features of the system. The most striking feature of the Ganz electric railway is the abolition of the locomotive and the use of what is known as the "multi-unit" method. Motors are distributed throughout the train at intervals, an arrangement which, it is claimed, results in a more equal distribution of weight and greater speed.

A Safe Lift.—Sir Frederick Bramwell will have his little joke. In a letter to the "Times" he describes a small hydraulic lift to carry one person which he designed ten or twelve years ago for use in his house at Hyde Park Gate. "It was guided up the well-hole of the ordinary staircase without anything surrounding it, and access was obtained by making a gateway in the handrails on each landing and by fitting to each opening a spring gate. The lift itself was fitted with a gate so that the occupant might not tumble out as he went up from floor to floor. I caused to be arranged (not as any matter of invention, but more as a common precaution) a simple device by which none of the spring gates could be opened unless the lift was opposite to the opening, and I also had another arrangement by which the doors of the lift itself could not be opened unless the lift was opposite to a spring gate. This thing has worked perfectly for the ten or twelve years it has been in existence; I came down by it this morning and I hope to go up by it to-night. It appears to me that if an arrangement of this kind, by which it would be rendered impossible to open any lift door, on any floor, unless the lift were there, were in general use it would prevent such an accident as that which you recorded."

Masters and Men.

Strike of Glasgow Joiners.—About 500 Glasgow joiners stopped work last week as a protest against an intimation of their employers that wages were to be reduced from 10d. to 9d. per hour. About 20 firms intimated the reduction on the proposal of the Master Wrights' Association.

Derbyshire Lime Trade Dispute.—There is no prospect of a settlement of a dispute in the lime and stone trade of the Buxton district, which extends over Peak Dale, Dove Holes, and Miller's Dale. All the quarries are deserted, and the men express themselves as determined not to sign an agreement binding themselves for a year, considering such is most unreasonable. They are nearly all members of the Trades Union.

The Lockout of St. Helens Joiners, which has lasted for the past six months, has come to an end. The joiners gave notice that on and after July 1st last year they would not fix any foreign-made joinery, this term being applied to all joiners' work made in shops where trade union conditions do not prevail. There were only two or three shops affected, but the St. Helens Master Builders' Association decided to lock out the whole of the members of the two trade unions of which the local joiners are members. The employers and employed have now had a conference, and decided that the lockout should come to an end, the question in dispute to be left over for future consideration. The men had also given notice of a demand for an increase of a halfpenny per hour in their wages and certain other alterations in their working rules, but they have withdrawn the notice.

Halifax Joiners' Dispute Settled.—Through the efforts of the Halifax Building Trade Federation, which resulted in a conference between the parties last week, the dispute between a number of Halifax operative joiners and their employers which has lasted 105 weeks, has ended. The employers will make an advance of a ¼d. per hour on their original offer, making it ½d. per hour, and will concede a rule asked for by the men with regard to the grinding of workmen's tools. On the other hand, Rules 3 and 4, which had for years been a source of friction between masters and men at Halifax, are to be framed as the employers desire. It has also been agreed that, with the object of avoiding disputes in the future, an annual October conference of masters and men shall be held, at which all trade questions shall be considered, and that no strike or lock-out shall take place until the decision of the joint committee in conference has been made known

Surveying and Sanitary Notes.

Three Women Sanitary Inspectors have been appointed by the Southwark Borough Council at salaries of £160, £130 and £120 per annum, and it has also been decided to engage two women as inspectors of infectious diseases at salaries of £110, rising to £160.

"How to become a Municipal Engineer" will be the title of a new book to be published shortly by the St. Bride's Press, 24 Bride Lane, London, E.C. The author is Mr. J. Freebairn Stow, member of the Association of Municipal and County Engineers, member of the Society of Engineers, and engineer and surveyor to the Uxbridge Rural District Council, previously having been in the employ of the Public Works Department, Cape Colony. The work will be on sale at 1s. nett.

The Upkeep of London Streets.—Landscape gardening in Fleet Street still proceeding, and likely to last well into next summer. Municipal Councils most active in the conduct of operations. Half of the labourers are hard at work leaning on the guard rail, and smoking pipes with the utmost vigour, whilst other half constantly engaged in meal of some description. Occasionally a small drainpipe is lowered into grave-like trench, but this is of infrequent occurrence.—"Punch."

Southwick to be Southwick-on-Wear.—There being seven or eight places in the United Kingdom bearing the name of Southwick, as well as another recently created urban district of that name, the Southwick Urban District Council, in the County of Durham, with the consent of the County Council, have decided to change its name to Southwick-on-Wear Urban District Council, and the name of the place to Southwick-on-Wear. The object is to prevent a continuance of the miscarriage and delay in delivery of letters, &c.

London's Street Refuse.—The Corporation have for some time past been considering the question of dealing with the dust and refuse from the City, and among other things the practicability of generating electricity from steam raised by burning the refuse. Acting on the reports of Mr. D. T. Ross, the City engineer, and Mr. A. A. Voysey, the electrical engineer of the City, the Streets Committee have advised the Corporation to barge the dust and refuse into the country, and to obtain some suitable site for the purpose.

R. I. B. A.

PRIZE AWARDS, 1901.

Difficulties in Producing Good Modern Architecture.

A MEETING of the Royal Institute of British Architects was held at 9 Conduit Street, W., on Monday evening last, when the President, Mr. William Emerson, occupied the chair. Mr. Alexander Graham announced with regret the death of Mr. John J. Burnet, of Glasgow, and it was decided that a letter of condolence should be sent to the relatives. Mr. Burnet was eighty-seven years of age, and was elected a Fellow of the Institute in 1876: his name ranks high among the architects of Scotland. The Secretary then announced the prize awards for 1901 as follows :—

Institute Silver Medal and Twenty-five Guineas (for an essay on "The Comparative Desirability of the Formal or Irregular Treatment of Street Architecture in Large Cities"): Prize, Arthur Maryon Watson, B.A. (London); certificate of hon. mention, William Curtis Green (London). Three essays were submitted.

Institute Silver Medal and Ten Guineas (for measured drawings of ancient buildings): Prize, Lawrence L. Bright (Nottingham), whose drawings were of Kirby Hall, Northants; medals and five guineas each to Wyatt Papworth (London) and Henry Francis Traylen (Stamford). Eight sets of drawings were submitted for this prize.

Soane Medallion and £100 (subject, a design for a club house in a large city): The Council regret they are unable to award this medallion. They, however, decided to award thirty guineas each to Matthew James Dawson (London), H. Munro Cautley (Westerfield, Ipswich) and J. B. Fulton (London). Twenty-two sets of drawings were submitted for this prize.

Owen Jones Studentship: Certificate and £100 (for travel, and study of colour): Prize, Hervey Rutherford (London); medals of merit each to Percy E. Nobbs (Edinburgh) and Ramsay Traquair (Edinburgh); certificate of hon. mention, E. Bennett. Six sets of drawings were submitted for this prize.

Pugin Studentship: Silver Medal and £40 (for travel in the United Kingdom): Prize, Henry William Cotman; medal of merit, J. Forbes-Smith; certificate of hon. mention, A. J. Pitcher. Nine sets of drawings were submitted for this prize.

Godwin Bursary: Silver Medal and £40 (for travel outside the United Kingdom): One strainer only was submitted, and the Council decided not to award this prize.

Tite Prize: Certificate and £30 (subject, a design for an entrance gateway to a public park): William Fairbairn (Edinburgh); award of ten guineas, Ralph Knott (Chelsea); certificate of hon. mention, William Arthur Mellon (Ashwell, Herts). Twenty-six designs were submitted for this prize.

Grissell Gold Medal and 10 *Guineas* (subject, a design for a timber footbridge across a stream): Prize, James Edwin Forbes (London).

Ashpitel Prize (books to the value of £10): Shirley Harrison (Leicester); extra prizes of £5 each to C. H. F. Comyn (London) and C. E. Varndell (London).

The Council approved the drawings received from James McLachlan (Pugin Student, 1900), Percy E. Nobbs (Tite Prizeman, 1900) and John Stewart (Owen Jones Student, 1899).

Mr. Stevenson's Paper.

After the above awards had been announced a paper was read by Mr. J. J. Stevenson, F.S.A., on "Difficulties and Hindrances in Producing Good Modern Architecture," Mr. Stevenson said that the difficulties besetting modern architects were due to the conditions of modern life as compared with those of former times. The hindrances were the laws and regulations which restrict practice and the natural development of building. Traditional architecture did not cease with the new life of the Renaissance, and though the mediæval styles lived on, the new architecture soon became a custom and tradition which every workman knew and could carry out without drawings from an architect. It is only in the last two or three generations that architecture has emancipated itself from tradition; that builders and architects, instead of conforming to established custom, have followed their own fancies and have done what was right in their own eyes, every man being a law to himself. Instead of the few whose force of genius broke through tradition and made an advance in the style, each architect and builder now thinks he must be original, and as original genius is scarce, so are good buildings. The best hope for new architecture is a thorough knowledge of the old, not a superficial acquaintance with many different styles. The style must be assimilated so that the architect can think in it and use it as he does in his native tongue.

It might be thought that competitions, with an architect of standing as assessor or as judge, would secure good architecture by criticism and selection of the best designs. But the result has not justified the hope, and there is now a tendency to abandon the system. In a competition the architect works in the dark; he has to guess what is wanted, and no information the assessor can give in his instructions to competitors can adequately supply it. Architects whose local standing might have entitled them to be appointed for the work, who possibly know more of the conditions and requirements than the assessor, hesitate to be judged by their drawings alone in competition with some young unknown architect from a distance, who, if he is unsuccessful, has no character to maintain in the district. Sometimes the assessor is one whom architects may fairly decline to be judged by. They may know that he does not understand their art, and his instructions may show that he is ignorant of the requirements. In these he takes a power of decision more absolute than judges in law cases ever claim; they decide only after hearing both sides of the case, and they give reasons for their judgment. But the assessor hears no pleadings and gives no reasons for his judgment. Might not his proceedings be in some degree assimilated to those customary in law cases? The competitors, having studied for months the problems involved, would be able to point out to him how far their plans had solved them, and where their opponents had failed. It is possible that, however fair and able, the assessor may have missed them. They should not be condemned unheard. As to the objection that the assessor would then know who the competitors were, and might be influenced to give the award to a favourite or a friend, such a suspicion amounts to a libel on the assessor's character. It would be more dignified for the assessor to declare himself incapable of such action by making the decision, knowing who the authors were. It might prevent his overlooking merits in the plans of architects whose character and reputation and the work they had done are a guarantee that they could be trusted to carry out the work. By refusing to know the competitors, the assessor neglects what is a far more important consideration in the selection of an architect than making competition drawings. The faculty of winning competitions is often not a gift of the best architects. The selection of the assessor is the most important factor for the fairness of a competition. Why should not the competitors appoint him by their votes? It would give a better guarantee that they could trust him to understand and appreciate their designs, and if the majority appointed one whom they thought unlikely to do so, they would be able to withdraw before wasting their time and risking their reputation. There would be a better chance of just decision if there were more than one judge, as in important cases in the Law Courts. Opinions vary as to what constitutes good architecture; different views of what designs are best may honestly be held. A judge may see fit to alter his opinion on the representations of his colleagues. As regards the labour and money risked by competitors, there should be a stipulation that architects invited to compete should each be paid a sum towards their outlay. Competitions, wisely conducted, might advance the art and produce good buildings. They should be made such that other architects than those who usually gain them would not hesitate to engage in them; that work done, as well as the accidents of competition drawings, should be an element in decision; that the judges should have the confidence of the competitors for their appreciation of art in architecture in the various developments now prevalent.

In considering the hindrances in producing good architecture the author referred to the modern rules and regulations by which the designs of buildings are hampered and restricted. These have generally been devised by doctors and sanitary experts for excellent and necessary objects. But instead of availing themselves of the knowledge and experience of architects they devise crude and often tyrannical rules without adequate knowledge of building construction, and without thought as to the architectural appearance or the cost of their requirements. The London Building Act would have been a far more effective measure had the County Council arranged with a body of architects, such as the Institute, the provisions for ensuring the necessary requirements, and the £20,000 Parliamentary expenses would have been saved. The Local Government Board's Model By-laws ignored local modes of building, and reduced houses all over the country to a uniform level of dulness The recent Police Act for Scotland, to ensure. ventilation, decreed that ground-floor ceilings should be 9ft. 6in. high, and bedrooms 9ft. But this did not ensure ventilation; it rather provided space for vitiated air to accumulate. Such regulations spoiled cottage architecture, made buildings needlessly costly—indeed prevented cottages being built. Equally foolish and costly is the regulation that every sleeping-room over 100ft. in area should have a fireplace and flue, though it would probably never have a fire in it and would most likely be stopped up with a smoke-board. Why forbid half-timber construction? It is a most charming development of old English architecture, and houses so built have lasted for hundreds of years. It gives beauty to landscape, and the risk of fire is insignificant in isolated cottages. The precautions against fire are needlessly oppressive for low or isolated houses. Carrying the party-walls above the roofs in ranges of low houses spoils their appearance, and is unnecessary if the slates are bedded on the walls.

In some rural by-laws the needlessly tyrannical provision that all woodwork should be kept back 4½in. from the face of the wall has been revived after it had been removed from the new London Act. Another needless regulation, showing ignorance of building construction, is that compelling footings to be put to walls besides concrete foundations, which are perfectly stable without them. In conclusion, the author urged the Institute to press upon the authorities the acceptance of by-laws ensuring sanitation, ventilation, fire prevention and stability, but drawn with common-sense and knowledge of building by-laws which would not hamper and ruin architecture and cause needless cost.

A discussion followed in which Messrs. William Woodward, Lacy W. Ridge, John Slater, Lewis Solomon, W. D. Caröe, Maurice B. Adams, E. W. Hudson, Aston Webb and William Emerson took part. Mr. William Emerson stated in the course of his remarks that the Council of the Institute had that afternoon decided to approach the Local Government Board again with regard to altering the too stringent by-laws in country districts and to remind the authorities of the promise made by the political head of the department under the late Government.

Baron Johann Faber, who was practically the founder of the celebrated lead-pencil factory carried on under his name, died last week in his eighty-first year. When as a young man he succeeded to his father's business, which turned out cheap pencils of an inferior sort, he employed twenty hands. At the time of his death upwards of 1,000 men worked at his different factories. By his energy and business aptitude Faber succeeded in driving English-manufactured pencils, at one time almost in universal use, out of Germany.

Bricks and Mortar.

APHORISM FOR THE WEEK.

Art is born of the observation and investigation of Nature.—CICERO.

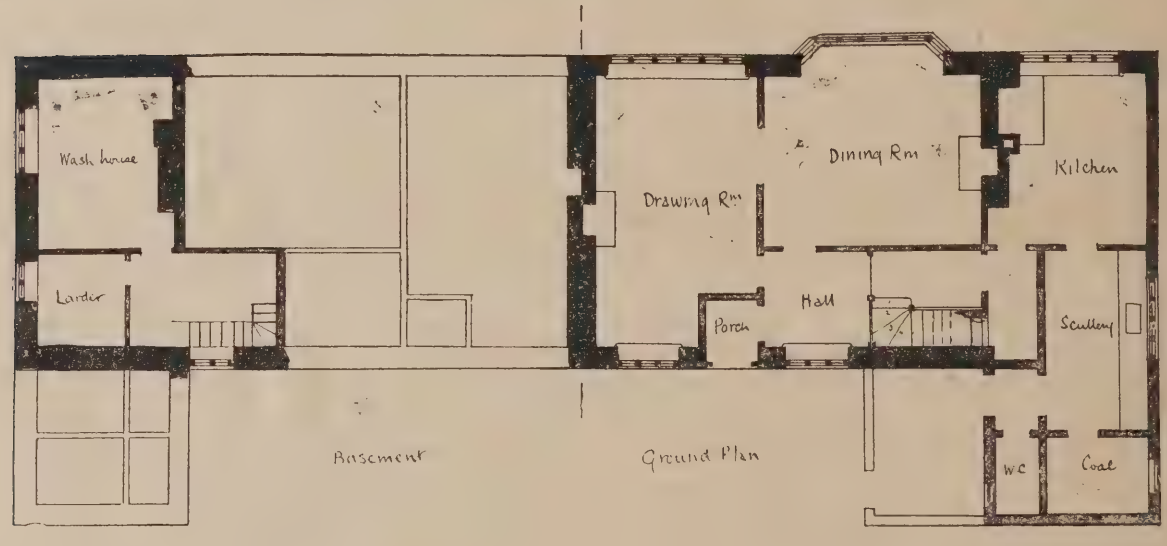
Our Plates. PARTICULARS of the small country houses by Mr. Baillie Scott will be found in the article which begins on page 468 of the current issue.—Mr. C. F. A. Voysey's house, "The Orchard," Chorley Wood, Hertfordshire, is built of brick cement rough-cast, with Bath stone window dressings, iron casements and green American slates, not with wood frames and tiled roof, as shown in the perspective. The hall and kitchen offices are paved with Delabole slate slabs. Messrs. Wenham and Waters did all the casements, glazing, internal plumbing and hot-water supply. Hot water can be drawn at any time day or night. The contractors were Messrs. J. Bottrill and Son, of King's Road, Reading. The contract price was £1,800. The roof is boarded and felted, and the cellar walls are built with "Hygeian Rock" composition. Each room has its foul-air exhaust shaft. The doors are batten doors fitted with W. B. Reynolds' strap hinges and latches. The house stands in an old orchard of 2½ acres, and is beautifully situated.

Reconstruction of Royal Infirmary, Glasgow. A MEETING of the Executive Committee for the reconstruction of the Glasgow Royal Infirmary was held last week in the City Chambers, Lord Provost Chisholm presiding. Mr. James Miller, I.A., of Glasgow, whose plans have been accepted by the Committee, submitted a report as to the order and method for proceeding with the work. The chief points he had in view were:—(1) That a considerable portion of the permanent buildings should be erected before any part of the present structure is demolished, and so that the bed accommodation of the institution will at no time during the reconstruction be less than it is at present; (2) to incur as little inconvenience as possible to the patients and staff during the reconstruction; (3) to avoid as much as possible the necessity for temporary buildings. With these points in view he recommended that the reconstruction be proceeded with in the following manner:—(1) To erect the north wing or surgical block on the space between the present north block and St. Mungo's College. This block is 290ft. long, and contains thirteen large wards and twelve small wards, containing in all 224 beds. The block is six storeys high and will take about two years to build. (2) When the above block is ready to receive patients, those in the present south block would be transferred to that block. The present south block would then be demolished, and the building of what is called the Jubilee Block proceeded with. In order to hasten the early completion of the Jubilee Block, Mr. Miller suggested that the contracts for same should be got out, say, about twelve months before the completion of the north block. The work would then be placed in the contractors' hands and all the material could be prepared and made ready for erecting, so that immediately the north block was ready for occupation the south block would be demolished, and the erection of the Jubilee Block commenced. With the hewn work and all the materials ready, he sees no reason why this block should not be ready for the roof within eight months from the time it is begun. The Jubilee Block contains 239 beds, which, with the north block, will give a total of 463 beds. (3) On the completion of the Jubilee Block the next portion of the buildings to be erected would be the main central block, which runs north and south and forms the connecting link between the north and the Jubilee blocks. The erection of this block would complete the whole of the main buildings. Mr. Miller thoroughly approves of the suggestion made by the sub-committee that it would be an advantage to erect a temporary kitchen and stores in a more central position than the present kitchen, which is at the extreme end of the site. The minutes incorporating the above report were unanimously approved.

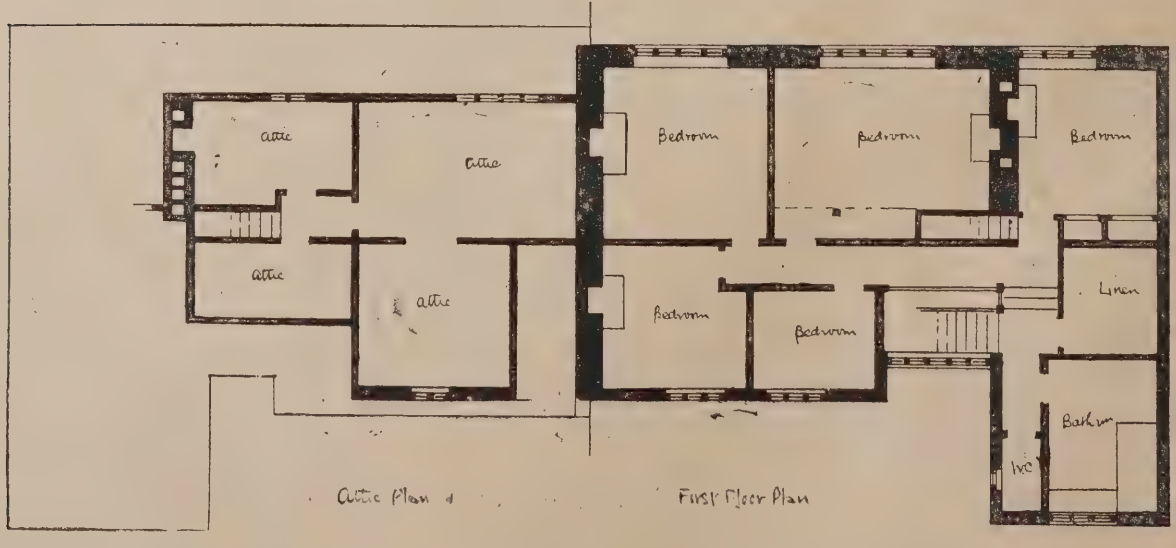
A little more Criticism. WE are glad to see that the "North British Daily Mail" adopts the same attitude as ourselves (see page 449 of last week's issue) in regard to the above committee's action in putting aside the assessor's award. The following are extracts from its criticism: "What was the use of appointing a high architectural authority like Dr. Rowland Anderson to examine the plans and select the best of them if his decision was to be subject to rejection by a body of gentlemen whose architectural education has not been begun? Take their leader for instance. He may be a magnificent hammerman, but his dearest friends would never dream of him as an architect. It is really absurd that the deliberate award of a duly-appointed architectural expert should be flouted by men who know nothing of architecture, and it is most improper that favouritism should be shown by going outside the short leet for a plan and an architect. Sir David Richmond said that the sub-committee had exercised their best judgment, but their 'best judgment' on a subject of which they are ignorant is simply ridiculous when opposed to the judgment of a master of the subject. And what sort of judgment do they show by plunging into an enterprise which will cost nearly three times the amount of money which they have at their command? We would all like to see a better building for the Royal Infirmary, but the project has not been gone about in such a way as to enlist the support of the public. It was not the citizens who decided that this should be the form in which they would commemorate the Queen's Jubilee. Sir David Richmond, then Lord Provost, took it upon himself to launch the scheme. That one-man mismanagement of a public matter was exceedingly tactless, and it was resented at the time, yet the same sort of thing seems still to dominate all the arrangements. It is much to be regretted that the proceedings show a high-handedness and recklessness which repel public confidence."

Haddington Abbey: "Restoration" Again. THE latest building of importance which is threatened with "restoration" is Haddington Abbey. It was handed over to the Board of Works by the heritors on the understanding that it should be maintained. Some well-meaning people have, however, been filled with the misguided desire to restore it, though Mr. Thackeray Turner, the secretary of the Society for the Protection of Ancient Buildings, states that this is against the wish of the leading men of the neighbourhood. "Unfortunately," says Mr. Turner, "we learn that an anonymous donor has offered to bear the cost of 'restoration.' Our fear is that this generous and well-meant offer may make it difficult for the Office of Works to do what we feel sure would be its wish and to refuse the offer, but the building is such a priceless and unspoilt work of art (as its well-known name, 'The Lamp of Lothian,' goes far to show) that its loss to us by 'restoration' cannot be borne with an even mind. The society is most anxious that it should be maintained, but 'restoration' is not maintenance. Would it be unreasonable to suggest to the anonymous donor that, as a place of worship is really needed, he would be conferring a far greater good if he would bear the cost of a new and really suitable church, leaving Haddington Abbey alone?"

Elementary Art Education. A COURSE of four Cantor lectures on "Elementary Art Education" was begun last week at the Society of Arts by Mr. J. Liberty Tadd, director of the Public School of Industrial Art, Philadelphia, U.S.A. The lecture was concerned with art and manual training in general education, and Mr. Tadd discussed the methods and results of the system introduced by Mr. C. G. Leland into Philadelphia twenty-two years ago. At first the work was experimental, but now that its advocates had the grown-up product to prove the success of the methods pursued it was spreading as rapidly as teachers could be trained, and they were glad to publish their results. The system was entirely different from that carried out in other schools, and its aim was the development of the whole organism—hand, eye and mind—by the acquisition of conscious control, to be followed by automatic control. Various exercises had been tried at different times, but they had now settled down to four—drawing, designing, clay modelling and wood carving. The desire was to give the pupils facility of hand, sense of balance, size and proportion, &c., and to make these qualities automatic. Teachers of the system claimed to be able to teach every possible physical co-ordination if only they got the child at the proper period of growth and development. Young children of five or six would be set to draw, for example, large circles on a blackboard—first with one hand, then with the other, then with both together, in the same direction and in either direction; and this was alternated with drawing on paper, in soft clay, and in tough wood—all to gain facility. Then the children were given some unit such as a spiral or leaf form and required to make designs from it, in order to develop sense of balance, proportion, &c. The copying of nature forms followed, and in course of time, by repetition of experiences, drawing became to them a mode of thought expression. Except in late stages, where specialisation was beginning, instruments of precision, such as measures, compass or ruler, were never allowed, nor was rubbing-out permitted; the results in consequence showed a swing and freedom not otherwise attainable.



Old Inns. IT is gratifying to observe how many zealous friends our cathedrals and churches are nowadays endowed with, but while we turn our attention to the preservation of these architectural glories we must not neglect the fascinating old hostelries which recall to our mind many a scene in our Fielding, our Dickens, or our Scott. "Unfortunately," says a correspondent of the "Morning Post," "the Red Lion and the King's Head ofttimes fall a victim to the aspirations of a latter-day host whose artistic eye has a predilection for stucco and slates rather than for the richly-tinted tiles and solid timber which have stood through centuries of stress and storm. Can nothing be done, we ask, to preserve these quaint and picturesque relics of olden days? The growing necessity for larger and more convenient premises may be urged in exculpation of the alteration and destruction of the old coaching inns; but surely the matter might be entrusted to the superintendence of a committee of architects who could determine how to remedy the inconveniences and yet retain the ancient character of the building. Tewkesbury, that delightful old abbey town of Gloucestershire, is a worthy example of what can be done in the way of judicial restoration, and it is indeed a pleasure to see the black and white oak-beamed hostels so lovingly handed down to posterity. Truly has it been said that 'England is one vast museum,' but the richest storehouses cannot withstand such frequent depredations, and it behoves us to look around ere it be too late and endeavour to save the old inns which are so eminently characteristic of our country, and which have been the wonder and envy of our Continental friends throughout mediæval times."



A Judge's Opinion. A WRITER remarks in the "Croydon Advertiser and Surrey County Reporter": "One of your daily contemporaries, I see, refers to an outbreak of builders' cases in the Lambeth County Court circuit, in consequence, so it is said, of the retirement of Judge Lushington. I do not think that Judge Lushington had anything to do with the Lambeth County Court, and therefore his retirement cannot have much to do with it. The article referred to ascribes to the judge the dictum 'that the whole building trade is corrupt throughout, from architect to hod man,' and I don't think they are going too far in thus describing his Honour's views." If this is so, Judge Lushington is exceedingly ignorant of the facts. There are of course black sheep in every flock, but to say that the whole building trade is corrupt is nonsense.

Enquiries Answered.

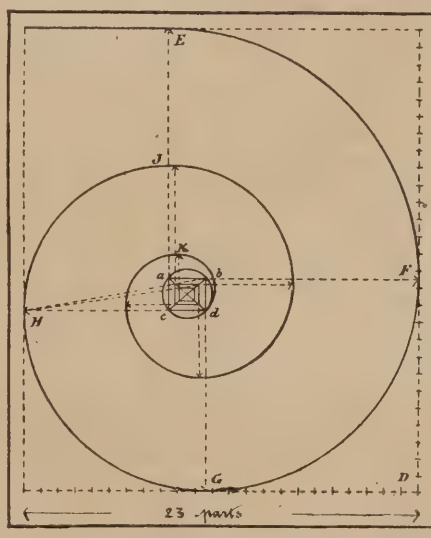
The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

The Grecian Ionic Volute.

MORECAMBE.—P. H. E. writes: "What is the method for setting out the volute of the Grecian Ionic column? Also, what are the proper proportions of the column and entablature?"

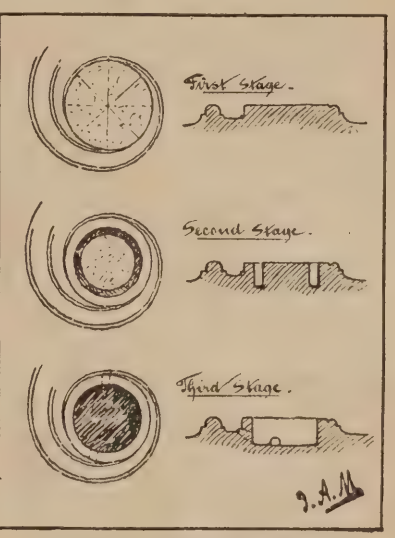
How the Greeks developed the Ionic volute is not known. Several methods have been invented—mostly based on the Vitruvian—by which a spiral is struck in segments or quarters from a number of centres. Perhaps the most satisfactory is that given in Pennethorne's "Geometry and Optics of Ancient Architecture"; it was invented by Mr. John Robinson, architect, and is said to produce the Greek curves almost exactly. Mr. Penrose, however, thinks it likely that the curves of the Greek volute were not produced by a geometric, but rather by a mechanical, process, namely, the continued motion of unfolding a cord from a helix cut in the form of an Archimedean spiral, and fixed temporarily in the eye of the volute. The curves thus produced are said to possess a refined continuity lacking by the other methods, and more in harmony with the best Greek examples.

The deep circular sinking so often seen in the *oculus* or eye of the Greek volute would seem to support the theory of a temporary fixture as a guide to the workman in describing the curves; but this sinking is not found in all instances, and there is evidence to show that sometimes it was not cut until after the completion of the volutes. Some unfinished caps in the British Museum, from the later temple at Ephesus, form an interesting series in this connection, showing, as they do, the eye of the volute in three stages of completion. In the first stage the eye is a plain projecting disc, with faint traces of "setting out" lines inscribed on its surface. In the second stage the sinking has been commenced by cutting a deep groove all round, just within the outer edge of the disc, preparatory to cutting out the whole of the interior, and leaving a projecting ring, as we see it in the third or final stage. In other respects the volutes are finished. It is probable that the "eyes" of, at least, the outer range of columns were filled in with gilded pateræ of bronze, and the finished example in the Museum has two holes bored through the rim which may have served to facilitate the fixing of some metal enrichment. More often a separate plug of marble was inserted; but why this was not worked on the same stone as the cap we cannot say. Some of these are still remaining in the caps from the Mausoleum, and in an angle volute from Phigaelia; on one side of this volute the plug has dropped out, and the marks of a small borer by which the sinking was made are clearly visible.



We give, in case it may be useful, a method invented by Mr. Joseph Gwilt "of inscribing a volute in a parallelogram." Multiply the height by the breadth, divide the product by the sum of the height and breadth, subtract the quotient from the height, and the remainder is the radius of the first quarter revolution of the spiral, set from *a* to E and F. F D gives the radius for the second quarter, set from *b* to F and G, and so on, using as centres *d* and *c*, until the fourth quarter is reached terminating at J.

Draw diagonals in the small parallelogram *a b c d*, and draw b H cutting the diagonal *a d*: then this will give a point for another parallelogram, whose angles will be the centres for the radii of the second revolution from J to K, and by repeating the process the spiral may be finished. It may be noted that as the height and breadth of the enclosing parallelogram approach equality the number of revolutions increases, and, of course, when the height and breadth are equal, the spiral vanishes and a circle is inscribed. In the best Greek examples the spiral encloses the "eye" more completely than in the diagram, and the enlargement of the outer convolution, from E to F, is more rapid. Another method will be found in Peter Nicholson's "Principles of Architecture."



As to the proportions of the Ionic "order,' the Greeks do not seem to have been guided by any hard and fast rule. Taking the lower diameter of the column as a standard of measurement, and dividing it into 60 parts, the following is the result when applied to the Erectheion: *North portico.*—Diameter of columns, 2ft. 9in.; height, including cap and base, 9 diameters; architrave, 49 parts; frieze, 47 parts; corona, 20 parts; cymatium missing. *East portico.*—Diameter of columns, 2ft. 3in.; height, including cap and base, 9⅓ diameters; architrave, 55 parts; frieze, 53 parts; corona, 23 parts; cymatium missing. A reference to the plan of this building will show that the columns of the east portico are closely set, and this may account for their somewhat slender proportions; whereas the columns of the north portico are very widely spaced, and this, on æsthetic grounds, required a column of stouter proportions.

The entablatures, it will be noticed, do not bear the same relative proportions to the diameters of the columns; in fact they are almost uniform in depth throughout the building; that of the north portico is, however, a trifle deeper than the rest—a variation demanded by the wide intercolumniations and the great extent of the stone ceiling.

The proportions of a small temple which once stood near the river Ilissus at Athens may also be given: Diameter of columns, 1ft. 9in.; height, including cap and base, 8¼ diameters; architrave, 55 parts; frieze, 49 parts; corona, 14 parts; cymatium missing. J. A. M.

GWILT'S METHOD OF DRAWING A VOLUTE.

VOLUTES FROM EPHESUS.

Chimney Shafts.

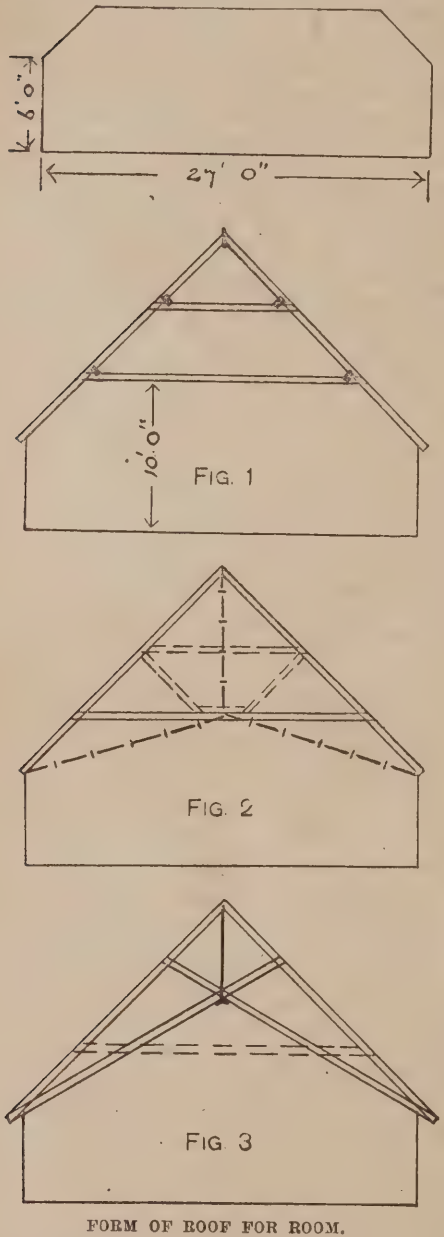
BRIGHTON.—PACKRACKS writes: "I should be glad of any information in regard to chimney shafts (for Cornish boilers) formed of material other than brick. Are they made of steel? How are they fixed? To what height can they be carried? Are they more economical than brick shafts, and, if so, is the saving considerable? Is there any firm who specially manufactures them?"

The writer has used wrought-iron chimney shafts 3ft. in diameter and 30ft. high for a range of six Cornish boilers, each 16ft. by 4ft. 9in. They were made in rings about 6ft. long, each ring being composed of two ¼in. plates. The top ring bell-mouthed about 1ft. deep, and the bottom length tapered to 3ft. 9in. diameter, and finished with a 3×3×⅜ angle. The riveting was ½in. diameter, 3½in. pitch, and 1¾in. lap. Three guys of ¼in. round iron were led from the top of each and made fast at the lower end. At the present time such shafts would be made of mild steel. They are permanent erections but do not last more than about ten years. They are not so economical in the long run as brick shafts, though, under certain circumstances, they are desirable. Any firm of boilermakers will undertake their manufacture. The foundations may be of brickwork, and it is then easy to connect the flues.

HENRY ADAMS.

R.I.B.A. Examinations.

BIRMINGHAM.—A. G. writes: "How far in algebra, mechanics, and physics is it advisable to be grounded in for the various subjects required in the Intermediate Examination of the R.I.B.A.? Would quadratics and progressions be far enough in algebra?"



Quadratic equations and progressions should be sufficient to pass, but as the examination is only preliminary to the work of an architect a student should be well equipped, and should know at least the application of the Binomial Theorem, Permutations and Combinations, and Logarithms, which will be found of the greatest value in applied mechanics and physics. For these last-named subjects the resolution and composition of forces, centre of gravity, &c., should be known. Trigonometry is, in our opinion, indispensable to an efficient training. The following books are suitable for study:—Hall and Knight's "Elementary Algebra" (Macmillan and Co., 4s. 6d.), Briggs' and Bryan's "Elementary Text-book of Mechanics" (Clive and Co., Booksellers' Row, Strand, W.C., 3s. 6d.), Lock's "Elementary Trigonometry" (Macmillan and Co., 4s. 6d.), and Balfour Stewart's "Elementary Physics" (Macmillan and Co., 4s. 6d.). When studying these subjects it is a great help to personally carry out the experiments described, and, if possible, to attend experimental classes in the subjects.

Roof for Room.

STUDENT writes: "Which is the best form of roof for a room of internal section similar to that shown herewith, and what would be the scantlings of the timbers?"

For an ordinary roof of 27ft. span, the most usual form of truss to adopt would be a king-post, and the scantlings would be somewhat as follows: Tie-beam, 10in. by 4in., principal rafters, 6in. by 4in; king-post, 5in. by 4in.; struts, 4in. by 3in.; purlins, 8in. by 4in.; common rafters, 5in. by 2in.; wall-plates, 5in. by 3in. These figures will give "Student" an idea of the proper scantlings for a special roof-truss to fulfill the peculiar requirements of his case. Assuming that the dimensions given are those between two outer walls, one of the methods shown in the accompanying sketches may be adopted. In any case these roofs should have good wall- and pole-plates, and be well and securely tied in on the end walls and at any cross-wall there may be. Fig. 1 is a not.

unusual form of construction in such a case, and shows two rows of collar-ties which would be spiked on every third rafter (there are no "trusses"). The whole roof consists of 5in. by 3in. wall-plates, 5in. by 3in. rafters, 5in. by 2in. ties, 5in. by 4in. purlins, and 7in. by 1½in. ridge. Fig. 2 shows a form of truss consisting of 9in. by 4in. tie-beam, with 6-in. by 4in. principal rafters, the whole braced together by ¾in. or ⅞in. iron tie-rods and king-rod, as shown in chain-dotted lines. If desired, a pair of 4in. by 3in. struts and a 4in. by 3in. (or 5in. by 2in.) tie may be added to this truss. Their position is shown in the sketch by double-dotted lines. If the use of tie-rods is objected to, a wooden truss, as shown at Fig. 3, may be employed. This consists of 6in. by 4in. prin-

FORM OF ROOF FOR ROOM.

cipals with a pair of long ties, 5in. by 3in., and a king-bolt to ridge furnished with shoes at top and bottom. A horizontal tie may be added as shown in dotted lines, just above ceiling level. "Student" will find a high-pitched roof of somewhat this same character in the drawings of Llandaff Cathedral published in THE BUILDERS' JOURNAL for December 26th, 1900.

G. S. M.

Tramway Conduits.

LONDON, W.—J. D. W. writes:—"Can you kindly give a sketch of a conduit tram (electric) system? I want to see just how the conduit is constructed."

We are always willing to help correspondents in all matters properly within the scope of this journal, and readers who desire answers to enquiries should bear this in mind. "J. D. W." does not recognise this. There are plenty of public libraries in London where books on electrical tramways can be seen. Our correspondent had better visit one of them; or write to one of the electrical papers. Another reader asks whether we can supply him with the name and address of a firm that makes "special cycle wheels for hand barrows and mail carts." No further comment is needed.

Charges for Overtime.

HASTINGS.—W. W. writes: "I should be glad to know whether architects' assistants can enforce payment for overtime if asked to work late."

In the absence of any definite agreement on either side, the principal is not bound to pay for work done after the usual office hours, nor is the assistant obliged to do such work. When there is a great pressure of work on hand it is usual however for the assistant to stay later than he otherwise would in order to expedite matters, but such extra work should certainly be recognised by the principal, either by allowing his assistant a little more holiday at another time or by paying him something extra for the additional work. But neither can force the other where no agreement in regard to overtime exists.

Builders' Notes.

The Employees of Messrs. Young and Marten, Ltd., held their second annual stock-taking dinner at the Town Hall, West Ham, E., recently.

Nottingham Master Builders' Association held its annual meeting last week, when the following officers for the coming year were elected:—President, Mr. Henry Vickers; vice-president, Mr. Frederick Fish; treasurer, Mr. J. W. Woodsend; hon. secretary, Mr. James Wright. The annual dinner was fixed for Friday, February 1st.

The Dublin Master Builders' Association held its annual general meeting recently, when the following officers were elected for the ensuing year:—President, James Beckett; hon. secretary, John Good, 55 Great Brunswick Street, Dublin; hon. treasurer, James Kiernan; committee, R. Denne Bolton, Thomas Connolly, Richard Collen, Thomas Mackey, William Meade, James Martin, Henry Pemberton, Kevin Toole, B. W. Whyte. A resolution was passed regretting the death of R. F. Lidwell, Esq., J.P., an old member of the association.

Mr. Francis Christie, builder, of Cluny, Scotland, died last week at the age of 81. Some considerable time ago he went to Aberdeen to reside with his son, Mr. Francis Christie, senior partner of the firm of Messrs. Christie, Greig and Co., granite manufacturers, and the death took place at his residence there. The son of a mason, Mr. Christie was born at Banff in 1820, where his father was then employed in the building of the harbour at that port. At the age of twelve he commenced to serve his apprenticeship with his father, who was at that time contractor for the mason work of Cluny Castle. On the completion of his "time" he worked as a journeyman in different parts the country, acquiring experience which afterwards fitted him for the position of master, to which he subsequently attained. His greatest work was the construction of Dunecht Chapel, library, grand staircase, and wing designed by the late G. E. Street, the workmanship of which may be classed as of the very finest ever executed in granite.

Fire Prevention at the Building Trades Exhibition.—In further reference to the special "Fireproofing" Section at the Building Trades' Exhibition which is being organised under the auspices of the British Fire Prevention Committee, the executive of that body, at a recent meeting, presided over by Mr. Edwin O. Sachs, decided to invite numerous representatives of the municipal, technical, insurance and industrial interests concerned to visit this elaborate demonstration of means and ways for reducing the modern fire risk. Among those to whom invitations are being issued are the provincial chairmen of Works Committees, engineers of the large dock and railway companies, principals and masters of the technical colleges and polytechnics, &c. Special arrangements are being made by which the visitors will have every facility for studying the subject, and the committee will no doubt also entertain at their new Testing Station at Westbourne Park. A sub-committee has been appointed to take charge of matters relating to the section, comprising Mr. F. Hammond (chairman), Mr. Max Clarke, Mr. Frederic R. Farrow, Mr. Chas. E. Goad, Mr. Ellis Marsland and Mr. Edwin O. Sachs, with Mr. H. G. Montgomery as business manager. Particulars of the general arrangements are obtainable from the committee's offices at No. 1 Waterloo Place, Pall Mall, S.W.

Fire Tests.—We have received copies of Nos. 51 and 56 of the British Fire Prevention Committee's publications. The former deals with a test made with two "Williams" fire blinds installed by Messrs. G. A. Williams and Son, of London, the object being to record the protection they afforded to a door and a window. The area of the door was 20ft. super. and of the window 16ft. super., and the seat of the fire was within 3ft. of the face of the blinds. It was found that the blinds (which are made of asbestos cloth) remained in position after a test lasting half an hour, no fire having come through. The second report is of a test made with a floor and ceiling erected by the Mural and Decorations Syndicate, Ltd., of London, the test lasting an hour and a quarter. The floor was 10ft. by 10ft. and was loaded with 1½ cwt. per sq. ft. distributed; six weeks (summer) were allowed for construction and drying. In five minutes most of the setting coat of plaster had fallen off. Various cracks developed in the plaster of the ceiling during the test, but no portion of the rendering fell. On the application of water the plaster fell off where struck by the jet, exposing the terra-cotta lathing, which, however, remained intact. After the test was concluded it was decided to replaster the ceiling and renew the test on another day. This was done, with practically the same results as those already stated.

The Tees-side and District Master Builders' Association held its annual meeting and dinner at Stockton last week. Mr. T. Dickinson, of Middlesbrough, presided at the meeting. Mr. W. C. Creasor presented the fourth annual report, which stated that the past year had been an extremely busy one. As a result of an advance of wages granted to the joiners in 1899 by the Stockton Association, several conferences were held with a view of arranging one set of rules to apply to the whole district, the wages being 9d. per hour all round. This was successfully accomplished, and was regarded as one of the best pieces of work done by the Association, inasmuch as when any demands are now made by the joiners they must be to all the towns alike and at one time, and must be dealt with by the Tees-side Executive Committee. During the year the bricklayers applied for and obtained, after an eight weeks' strike, an advance of a penny per hour at Stockton. The secretary then referred to the lock-out of the bricklayers in the Northern counties. In addition the dispute had been put before the Yorkshire, Lancashire, and Cheshire Federations, who had decided, failing a settlement, to lock out the bricklayers on February 2nd in support of their Federation. The report was adopted, and the following officers were elected for the ensuing year: President, Mr. T. Wilkinson, Middlesbrough; vice-presidents, Councillor T. E. Atterby, Stockton; Councillor Proud, West Hartlepool; and Mr. W. Bastiman, Middlesbrough; and secretary and treasurer, Mr. W. C. Creasor, Stockton. At the dinner, in reply to a toast given by Mr. A. Harrison, the President, Mr. T. Wilkinson, stated they had proposed arbitration in the present dispute with the bricklayers, and this they were prepared to keep to. Mr. T. Dickinson also replied. Councillor W. G. Roberts, of Middlesbrough, proposed "The Northern Counties Federation of Building Trade Employers," which was replied to by Alderman Ranken, President of the Federation, and Mr. J. W. White, President of the Sunderland Association.

ARCHITECTURAL ASSOCIATION:

FLATS.

By EDWIN T. HALL, F.R.I.B.A.

A MEETING of the Architectural Association was held at No. 9 Conduit Street, W., on Friday evening last, Mr. W. H. Seth-Smith, President, in the chair. The minutes having been read and confirmed, Messrs. H. Cayley, S. A. Hall, and A. S. Tanner were elected members. Mr. Edwin T. Hall then read a paper on "Flats," of which the following is a summary:—

A house of one story we call a bungalow, but "flat" is the name we give to a self-contained residence on one floor of a many-storied house. It is not euphonious, and it is not descriptive. The name betokens a lack of imagination, and it seems to me inept to adopt such a word to describe the abode of a large and increasing number of people. We do not often use the word for workmen's dwellings, but generally only for those of the richer class. We might as appropriately call an ordinary town house a "vertical." However, such as it is, the term is now accepted in England, or at all events in the south. In Paris *appartement* appears to be the accepted designation of such a residence as distinct from *pièce d'un appartement*, which designates a room in a set of apartments. In Germany there appears to be no word to distinguish a "flat" from a house proper, *Wohnung* or *Wohnhaus* are applied to both. I suppose it is not more than forty years ago when flats on any large scale were

Introduced into London.

Among the first, I think, were those stuccoed buildings in Victoria Street, and I can remember how some of them remained for years unfinished, so little or so slowly did the idea take on. This is surprising, because they had long been established in—for example—Paris and Edinburgh. In the provinces to this day there are many cities and towns where no flat is known, as, for example, in go-ahead places like Leeds, Liverpool, Manchester, and Cardiff, to cite places wide apart where there is plenty of energy and activity; and in two or three of these there are not any many-storeyed buildings for the working classes.

As illustrating the feeling that prevailed until the decade 1880–90, hardly any insurance company would invest in ground rents secured on flats or lend money on mortgage of such buildings. From about 1880, however, flats began to move—as the phrase goes—and the projects for

Their Erection Steadily Increased

year by year until we have now a very large number of such buildings in all parts of London and in many of the suburbs. Many people of the well-to-do classes who formerly only hired a house for the season now take a flat by the year in lieu of a town house, to which they can come when they please. With a town house absence means at least caretakers and structural maintenance, whereas a flat may be locked up and the keys left with the porter on the assurance that all will be safe during the tenant's absence.

It may be interesting for a moment to make a slight digression by noting that the period which has seen the birth, growth and acceptance of the flat as a residential unit has coincided with the immense development of hotel life in London. I can just remember the completion of the Langham Hotel. I heard people say that it was a mistake to build an hotel of that size, that it would never pay, &c. That was the pioneer of the modern hotels. It was followed by Charing Cross and Cannon Street, Holborn Viaduct, the Grand, the Métropole, the Midland, the Victoria, the Fifth Avenue, the Grand Central, the Russell, and others further afield. The restaurant, too, was of the same period. The Holborn Restaurant was the first of any size, I believe, to astonish the Londoner with its comparative luxury, cleanliness, and good cooking. This was soon followed, and now there are as many restaurants in London probably as in Paris, although not quite on the same lines.

Accepting, then, the fact that flats as a distinct class of property have taken firm hold of London and consequently afford an extensive field of operations for the architect, let us consider what are the problems to be solved when one has to design a building of this class. First,

Locality

will have something to say. If the site be in a main West-End thoroughfare where shops are the essentially lucrative part of the property and have to form the ground-floor or possibly two floors, it will not, as a rule, be found to be remunerative to put family residences above, but bachelor suites generally with one sitting-room, one bedroom, and a bathroom will be found to meet a considerable demand. In the side streets of clubland similar suites, sometimes with a manservant's room attached, will realise high rents. In Bayswater, Kensington, Chelsea, Westminster, &c, flats over shops will as a rule only be taken by the lower middle class, but in blocks which are exclusively residential and of good style there will be a considerable demand from well-to-do people of all sorts who do not wish for the trouble of a large house, the expense of a garden, &c., and who periodically shut up their flat and go away. In Hampstead probably as high rents can be obtained as in Kensington, but in Battersea Park, and still more in places like Brixton and such suburbs the style and the rents must be simpler and cheaper respectively. The locality, therefore, and consequently the class of tenant will exercise an influence on the whole design.

Family Residences.

I have noted that as a rule family residences for well-to-do people will not be readily taken if over shops and in the heart of London. It is strange that this objection does not hold in Vienna and Paris, where family suites in the heart of the cities are the rule, and are sometimes sumptuous. I suppose the difference lies in the temperament of the peoples. In England the mistress of the house and the family generally like to have the opportunity of being quiet. In France and Vienna the people are for bustle, vivacity, stir and movement. To some natures quiet is appalling and abhorrent. A recent book of new buildings in Paris—apartment houses—shows, of a total of fifty depicted, thirty-four are in main streets and have shops on the ground floor.

The Principal Staircase.

Another difference to be noted is that in Paris the rule is to make a service staircase in addition to the principal staircase; in Vienna and London this is not usual, although of course there are many instances to the contrary. In a building with only one principal staircase the service staircase is a great protection in the event of fire, and where the floors are extensive I think should be made compulsory, but it should be at a distance from the other, and should be next an external wall with windows in it to enable the smoke to escape. In some modern and handsome Parisian buildings there are stately principal staircases which are lighted by glazed partitions, or, as we call them "borrowed lights," from the service staircase which itself has windows. This is bad. If a fire occurred, and the flames went up one staircase, the other would be rendered useless for escape by the breaking of the glass partitions between. When there are two or more principal staircases this fire exit can be made by carrying both or all up to the roof, forming there a fire-resisting passage from one to the other.

In St. Ermin's Hotel and Mansions at Westminster, designed by me, where the buildings cover a site of about an acre, and there are about 660 rooms, I have six staircases with such intercommunication. It is strange that in Vienna very large blocks have sometimes only one staircase with a comparatively narrow passage leading to it from the street through the main block. In London the reason for excluding service staircases is generally the desire to keep tradesmen's boys out of the house, and to avoid the uncontrollable "back door." Very frequently goods are transmitted from the ground floor by small hand-service lifts passing outside the kitchen window or service hutch, and very useful and speedy lifts can be made by using bicycle wheels at top and bottom with ball bearings, wire ropes, and two balanced covered cages or buckets. Apparently in Vienna in many buildings all goods come up the one staircase to the front door.

Kitchens.

A further point to observe is the very small kitchens and offices of the Paris and Viennese flats; 13ft. by 10ft. appears to be considered ample, and many are much less. There is no scullery, but sometimes a small pantry with sink is attached. This, however, is by no means general, and a larder is still more rare. I am told that, small as the kitchens not infrequently are in Vienna, it is by no means unusual to find them very handsomely fitted, the walls tiled and decorated with handsome ware. My informant says sometimes £300 is spent in such a way, and the mistress takes her friends to see the kitchen.

Servants' Bedrooms.

Yet another point of dissimilarity from our practice is the fact that in Paris frequently there is apparently no bedroom for the servants within the suite. In some cases the servants' bedrooms for the whole building are on the top floor, although there are many separate suites in the building. I should think a good deal of inter-family gossip is thus exchanged. In Vienna generally one small bedroom for a servant is provided, sometimes opening only from the kitchen.

There is on one of the drawings exhibited at this meeting one handsome suite of rooms, with such a bedroom about 45ft. in area, in another 70ft. in area. These are not healthy. Certainly 100 sq. ft. should be a minimum. Of course, I do not know that other rooms may not sometimes be allocated to servants, but having regard to the few bedrooms and the size of the sitting-rooms this does not appear to be probable.

In London it is usual to house the servants within the flat, but here, as well as in Vienna, the vice of making a bedroom open out of the kitchen is still practised, and when one reflects that slops have to be carried through the kitchen in times of sickness and of health, it will be seen how insanitary such an arrangement is.

Sanitary Matters.

Our friends abroad are not always so particular as we are in other sanitary matters, and you will note some bath-rooms with no light and not against external walls, larders similarly situated, even behind water-closets, and the evil practice which obtained in England, even within the last half-century, is still maintained abroad, of lighting and ventilating water-closets from staircases and passages. Here that is no longer possible, thanks to our sanitary laws, and I feel sure that our friends abroad now realise the evil of such arrangements, and will not be offended at my mentioning the defects should any of them honour me by reading my paper.

Soil Pipes and Internal Staircases.

I have yet another little sanitary point to mention, and that is the danger of taking soil pipes of flats down inside the building against external and even internal walls in chases. Such chases afford channels for carrying infectious diseases from one suite to another; they are passages for vermin and for sound, to say nothing of the danger if the pipe leaks. Our laws have practically banished this evil from London, although I well remember to have seen it practised in some of our pioneer flats.

Internal staircases, however handsome they may be, with only top light and ventilation, are also to be deprecated in confined areas where there are many storeys of flats. Such staircases, in the event of fire, become furnace shafts, and at least get full of smoke, choking those trying to escape. The odours of the lower part of the house ascend to the top, and again illness is conveyed by them from one part to the other.

While many will realise the last-mentioned evil, it is not all who pay attention to the point I am about to mention, and that is the necessity for a current of air through small internal areas or courts extending from the ground to the sky. These small courts are frequently and not inaptly called "well holes." Now every one knows that the air at the bottom of a well is often so bad that a candle will not burn in it. A "well hole" area without through ventilation is in a lesser degree bad in the same way; and when, as is generally the case, there are gullies at the bottom giving off foul gases from fermenting deposits, it can be realised that windows opening into such areas are merely inlets for poison. All such areas should be ventilated by means of an inlet of large capacity at the bottom from some road or considerable open space where there is always movement of air going on. Fourteen or fifteen years ago I realised the evil and practised the remedy, and we obtained its insertion in the London Building Act of 1894. I was much pleased to see the necessity for this bottom inlet to small areas urged in a recent letter from M. Poupinel, of Paris, when he was kindly forwarding some of the drawings now exhibited, and it will be seen that he has inlets to his small courts in the houses Nos. 8 and 10 Rue Descamps. M. Poupinel has also taken fresh-air flues from the exterior to every fireplace in his building, and he has outlet ventilators in his kitchens. We, in London, are accustomed to outlet ventilators from not only kitchens, but reception rooms and bedrooms, but they are uncommon abroad, and the atmosphere of a stove-heated and unventilated room on the Continent is something to be remembered by those accustomed to fresh air.

There is only one further point to mention before leaving this hygienic branch of my subject, and that is the desirability in cities of having large windows in our rooms and keeping the tops of them reasonably near to the ceiling.

Floors.

A subject that may profitably engage our attention is the construction of the floors. In all high buildings for many families the floor should be of fire-resisting material. Some years ago Mr. Evans patented a floor which was composed of ordinary wooden joists laid close together and well spiked, thus making a solid wood floor. I do not know what has become of the system, but its tests showed it to be practically impervious to fire, and from its fibrous character it was claimed to be sound-proof. Another mode of constructing a floor is to fix rolled steel joists and build 4½in. thick brick arches between. This used to be the most common method of construction in London, and it is still much used in Vienna. Above the brickwork were wood joists and an ordinary floor. The most common because cheapest method used in England is, however, to place rolled steel joists at regular intervals, generally 2ft. apart, and to fill the space solid with concrete made of cement and coke breeze, bringing the soffit of the concrete an inch or two below the joists to protect the steel from the direct action of the fire. Frequently small fillets of wood were, and sometimes still are, laid on the concrete, and the boards nailed to the fillets; without ventilation, however, if the floor is covered with linoleum, such fillets and the boards over them may decay from dry rot, and the same remark applies to linoleum laid on boards nailed direct to concrete. One objection to the solid concrete floor is that it is not impervious to sound. The only way to remedy the evil is to get an air cushion beneath the floor itself, and to suspend the ceiling. There are several ways of doing this.

To get over the difficulty regarding wood floors where these are intended to be covered, I have in many recent buildings dispensed with boards, trowelled the floor with cement, and covered this with linoleum, either plain or ornamental. At once a furnished appearance is given to the floor, and rugs and carpets look well on it. The material is pleasant to the tread, it is not so resonant as wood, and there are no joints in which vermin may harbour.

I much fear that so much detail is wearisome, and yet it is valuable, and for the most part essential to an architect to know it all before he can start to make a good design with the hope of getting a successful result.

The Block Plan.

Turning now to the æsthetic side of the subject, let us consider the block plan. First of all, do not crowd too much building on your land. Doubtless a site that is crowded will show a large rent-roll on paper, but the building will not in the end be so popular as an open and more airy and consequently more healthy block, and the rents of the former will have to be reduced.

Of course the shape and extent of the site will largely determine the block plan, but or our purpose we will assume a considerable ar ea to be at our disposal. It may be laid out with a large carriage quadrangle in the centre, with the entrances from the courtyards.

In Mr. C. J. Pawley's St. James's Court, Westminster, we get one large courtyard with a narrow roadway on each side leading to it behind and through the front block. Another type is where the main entrances are from the roadways. There is a third method, as at St. Ermin's, Westminster, where the buildings are U-shaped, the large central quadrangle being open to the south or main front. This open quad may, however, be at the back if the aspect is more suitable at that side. This third method is shown in Mr. Paul Hoffmann's recent buildings, 171-5 Queen's Gate. The enclosed quadrangles permit of more land being covered than where the fourth side is left open, but the latter scheme has many other advantages. Even, however, on a comparatively small site a very pretty effect may be obtained by having a central circular carriage court, partially glass roofed, over the ground floor, the area above being open for lighting and ventilating the staircase and rooms.

Internal Planning.

Coming to a consideration of the internal planning of the buildings I think a good public entrance hall on the ground floor is a *sine quâ non*. The porch and vestibule should be simple, and may be plain. The hall should be spacious; not a mere passage, but a good room, well lighted, the walls panelled in wood to a considerable height, having a large, hospitable fire, and a panelled ceiling. Personally I do not like the "gorgonzola" and other marble wall effects which are so frequently seen in modern blocks. They are not, I think, in harmony with essentially domestic buildings, and I prefer the more cosy effect of a good hall in a country house. Of course columns may enter into the composition with great advantage, and any scheme of colour.

The Position of the Staircase

must of course be governed by the shape of the site, but if it can be made a part of the hall scheme so much the better, as it produces an effect of spaciousness which is valuable. I would draw attention to the very general feature abroad of staircases planned as semicircles, ellipses, or on other curved lines. The result is very pleasing, and contrasts favourably with the straight flights of stairs in a rectangular space so frequently seen. I do not like curved flights of stairs to extend without any intermediate landing, from floor to floor. These appear to me rather monotonous, as well as tiring and dangerous. They are, however, common in Paris. I thing the best planning, internally, is where on each floor there is but one flat off a main staircase. Such a flat is more private, and gives an idea of not being limited by its neighbour. There may, of course, even with this arrangement, be several staircases within the building itself, and several flats on a floor. Of course "the one staircase one flat" idea would only be practicable when the flats were of considerable size. When there are family suites, each of but five or six rooms, one staircase may reasonably serve two suites on each floor. This gives a certain elasticity to the place, as two small suites may then be combined and let as one large one. In high buildings I think it is not desirable to have a greater number of flats on a floor to one staircase. Mr. Hoffmann, at Queen's Gate, has his centre block with one flat to a staircase, and the wings with two flats to a staircase. The plan is an excellent example of how to lay out a large site.

Hall or Antechamber.

The planning of a flat itself is an interesting problem, one requiring great thought. First, there should be a good and well-lighted hall, or antechamber. The reception-rooms should be readily accessible from this, the bedrooms more retired, and the offices out of sight, but handy for service to the principal rooms and to trade access.

Efforts should be made to get away from a mere narrow passage hall, and to adopt some more compact plan. An octagon or a circle, a hexagon or an ellipse will form pleasing forms, and all admit of decorative treatments. The rooms, too, even in rectangular sites, need not all be square or rectangular.

Height of Rooms.

As to height of rooms, it appears to be very general to adopt about 10ft. to 11ft. in clear in all three capitals. I think this ample for moderate-sized rooms; a greater height makes them appear smaller in area. Windows should be ample, especially in a city, and I would draw your attention to the large size of doorways in the Parisian examples. Passages should be light, and the more direct the better. Do not forget to provide ample cupboards. Baths, sinks, water-closets, &c., should not be all over the place, but, within reason, grouped near together.

On the subject of planning, I would sum up shortly by saying, make your plans interesting, bright, and above all study to make them simple—the simpler the better. You may be sure if you see an intricate plan it is ill-digested, inconvenient, and generally not so well lighted or ventilated as it should be.

Small Sites.

We have hitherto considered only large sites, but there are a greater number of small sites which have to be treated, and I would refer you to Baron Max Ferstel's design of a house in the Stammgasse, Vienna. It is six storeys in height, the top floor containing studios. The other floors contain each a flat with five rooms, in addition to a kitchen with servant's bedroom attached and a larder. Here the two nurseries are placed at the rear, with separate service from the kitchen. There is also an access from the living-room to these children's rooms, so that the mother has a ready control. The bath-room and water-closet are ventilated into a small area, but the bath-room is only apparently accessible from the living-room, which appears to me to be an undesirable feature.

In London, Mr. John Slater's corner of Mortimer Street is convenient and well lighted. In Palace Chambers, Buckingham Gate, Messrs. Martin and Purchase have an angle site which appears to have required considerable thought to evolve a plan to give good light to all the apartments. Perhaps it may be permissible to mention one of my own buildings with a rather awkward site. It is a quadrant on plan at the corner of Sloane Gardens

Among the plans of bachelor suites we have one of Mr. John Slater's for a very shallow site in Well Street. He puts two suites to a floor off each staircase, and also, in addition to a parlour or sitting-room, two bedrooms, and a bath-room with water-closet in it, gives a small kitchen. The whole forms a very small self-contained residence, to be let at a low rent. Mr. Paul Hoffman, in Harewood Place and Hanover Square, has one staircase, a corridor common to several suites, each containing an entrance-lobby, a sitting-room, bedroom, bath-room, and water-closet, but the two end suites can be combined to make a family suite.

External Design.

It is undesirable to give a further detailed description of planning, and I will conclude by some observations on external design. Manifestly, the accessibility of material will have an important influence on design if the architect intends to display his building material. In Paris stone is practically always used. In London red brick, with or without stone, is generally used. In Vienna the construction is very largely of brick, but the facing is of stucco

or cement, and so are most of the columns and architectural detail, even in some of the largest buildings.

Owing to the commercial requirement that every floor of flats must be equally well lighted and to the structural desirability in high buildings of getting voids over voids, which together very generally result in windows being made of the same width on each floor, a Classic treatment is nearly out of the question.

Gothic, except in its latest English style, has not been attended with great success, and practically everywhere some branch or phase of Renaissance has become more or less the accepted basis of design. I have used the word Renaissance in a wide sense because, while some have introduced the normal Italian features, others have broken quite away from them. We know how, more in sorrow than in anger, one of our own Classic masters laments the depravity of a truant architrave or frieze in an entablature, and I can quite imagine the similar sensations of some of his Austrian colleagues at what is, I understand, there called the Secession style.

In Paris the architecture of the apartment house has generally its characteristically native treatment, shows great refinement, and, in my view, adapts itself admirably to the purpose of the buildings.

In London the most conspicuous block is on the Embankment—Whitehall Court, by Messrs. Archer and Green—a stone building, as to design based on French Renaissance. Most of the other flats in London are of red brick and stone combined. They are well known and accessible to all of you. Doubtless in some, and may be in all, there are features which, whether admirable or not, are suggestive, and from which you may derive an inspiration of great value.

My endeavour has been to recite first the practical and hygienic considerations regarding safety from fire, exits, ventilation, and sanitation, which form the very bed-rock on which to base a design; then on this basis to consider the æsthetic side, to suggest principles governing the laying-out of various sites, the internal planning and lighting of the buildings and their exterior treatment.

A WELSH CROMLECH.

By S. N.

AMONG the so-called Druidical remains of which Wales possesses so many, perhaps the most distinctive and interesting are the cromlechs. There appears to be much speculation as to the origin of the name. It is said it first appeared as "gromlech" in a work about 1600, but it may mean *grymlech*, stone of strength; *cæremluach*, devoted stone; *avegrymlech*, augurial stone; *Crom* or *crym-lech*, a stone that inclines or bends downwards. The capstone, many of which are of great weight, rests on two or more upright stones. In some instances, however, the cap or table stone has one end upon the ground. These cromlechs are termed *earthfast*. Occasionally the sides are closed up and an opening left for entrance or exit, while some, called *standing cromlechs*, are open and bear no evidence of ever having been covered.

It has been stated by some authorities that cromlechs were used as sacrificial altars, but the generally-accepted opinion is that they were merely raised for purposes of sepulture, except the open ones, which were probably associated with worship, and the *earthfast* ones, which are considered non-sepulchral. It is noteworthy that these erections, both in Wales and elsewhere, are so often found near the coast. In referring to a cromlech at Newport, Pembrokeshire, near to the Penbont stepping-stones, where the River Nevern meets the sea, Mr. E. Laws, in his "History of Little England," offers the following theory as to how such heavy stones were lifted up to their present positions. "Generally, but not invariably, these sepulchres are erected near to the rocks from which the stones were originally detached. Newport Cromlech is built on an alluvial flat. It seems scarcely credible that the large stones of which it is formed could have been floated thither on rafts, but the idea has crossed my mind. The method used in cromlech building would seem to be somewhat as follows:—First, the legs or uprights were erected, then these were buried in soil, and then the capstone was run up the inclined plane of this soil on rollers and carefully adjusted on the legs. Afterwards the soil was excavated from beneath the capstone."

In the parish of Nevern, adjoining, there are two cromlechs, one on a farm called Glasdir and the other at Pentre Evan. In the former the capstone is rounder than usual and of great weight, being supported on three upright stones nearly equidistant from each other, which probably suggested its name, "Llech-y-Drybedd" (Tripod Stone). The one at Pentre Evan, shown in the accompanying illustration, is probably the largest in Britain and is reputed to be one of the finest in the world. Old George Owen of Henllys, the historian, wrote of it two centuries ago: "The stones whereon this is layd are soe high that a man on horseback may well ryde under it without stowping.—There are seven stones that do stand circle-wise, like in form to the new moon, under the south end of the great stone.—I thinke that the true etymologie is *Grymlech*, that is, the stone of strength." Since that time, however, some of these stones have disappeared and the circle of stones which

surrounded it at that time can only now be partially traced. "The present remains are probably a portion of the chamber of a burial place so that there must have been at least one more covering stone, if not two. In the adjoining field may still be seen numerous immense masses, all of which must have formed part of the structure, which probably consisted of a square chamber approached by a gallery, formed in the same manner as the chamber, but perhaps of less height. It was also, there is little doubt, covered with soil, long since removed by man and time; and, as is so frequently the case, it is placed in a conspicuous position, commanding a view of the sea. It is curious that Arthur's name is associated with it, but that it was the burial place of some distinguished chieftain or warrior is most likely."

The future preservation of this monument is considered a matter of such great importance that it has been enclosed with a wire fence and is now under the protection of H.M. Commissioners of Woods and Forests.

A new Workhouse Infirmary at Skipton has been opened. The infirmary is a substantial building, devoid of elaboration, and has been erected from the designs of Mr. James Hartley, of Skipton and Morecambe. There are four wards, each capable of accommodating twelve patients, and the total cost, it is anticipated, will work out at £90 per bed.

Law Cases.

A Quarry Case.—At Newport (Mon.) Police Court Messrs. Howell Watkins and Thomas Christophers, quarry masters, trading under the name of the Machen Stone and Lime Company, were each fined £1 and costs recently for not enforcing the use of ropes by men employed on narrow and dangerous ledges in their Machen quarry. The proceedings were taken by Mr. J. S. Martin, H.M. Inspector of Mines, in consequence of a fatal accident which occurred at the quarry to a workman named Trew by his falling over the ledge on to which he was stepping down with a view to resuming work, *i.e.*, boring holes for blasting.

Architect's Claim for Fees.—At the Wolverhampton County Court on January 14th Albert Thomas Butler, architect, of Birmingham, sought to recover £79 1s. from Mr. A. B. Bantock, of Wolverhampton, alleged to be owing as fees for preparing plans for several houses. The plaintiff said he prepared the plans and obtained tenders for the erection of the houses, but owing to the price of materials going up the buildings were not erected. The defendant said his agreement was to pay Mr. Butler two or three guineas if the houses were not built, and five per cent. on the outlay if the work was proceeded with.—A verdict was given for the plaintiff for the full amount, with costs.

A Negligent Architect.—At the Shire Hall, Stafford, an Under-Sheriff's Court was recently held to assess damages in an action brought by Messrs. G. Boys and Son, timber merchants, of Walsall, against Mr. P. Adshead, architect, also of Walsall, to recover damages by reason of the alleged negligence of the defendant. It appeared that in September, 1899, plaintiffs desired to have a workshop erected on their premises. Defendant was engaged as architect and clerk of the works, his remuneration to be 4 per cent. on the total cost. It was contended that no sooner had the work commenced than defendant began to neglect his duties, until plaintiffs were eventually compelled to place the carrying out of the work in the hands of another architect.—The jury assessed the damages at £52 16s. 6d., the amount claimed.

Jerry Building.—At the Rotherham West Riding Police Court on January 14th a Nottingham builder named George Bell was summoned for having erected a certain dwelling-house at Tinsley which was not properly bonded in accordance with the by-laws of the Rotherham Rural District Council. Mr. B. Godfrey, the surveyor, prosecuted, and called George Brocklesby, an official of the Council, who stated that he visited the place where the defendant was building twenty-four cottages for the Tinsley Park Colliery Company, Ltd. The work was

extremely bad, and he could see distinctly through one of the walls. He called the foreman's attention to the work, and the architect had condemned a portion of it. A sample brick was produced for the magistrate's inspection, and it was evidently of inferior quality. Mr. F. C. Jenkinson proved that twenty-one courses and one angle had not been properly bonded. Defendant expressed his willingness to comply with the requirements. The Chairman said he was of opinion the case was a bad one, and fined the defendant 40s. and costs.

Apportioned Cost of Paving Works.—The case of *Fulham Vestry* v. *Minter*, heard last Wednesday in the Queen's Bench Division of the High Court of Justice before Mr. Justice Bruce and Mr. Justice Phillimore, raised the important question whether an open space vested in a vestry and dedicated to the purposes of a public park is liable to contribute to the expense of paving a new street. It was a special case, stated by Mr. John Rose, a metropolitan magistrate. The respondent Minter was summoned for refusing to pay the sum of £228 as owner of certain houses or lands forming or abutting upon a new street known as Bishop's Park Road, which houses had been set out for paving works. Mr. Rose came to the conclusion that the apportionment was invalid because the owners of the open space were not included as contributories to the expense of paving the new street. The Court dismissed the appeal. Mr. Justice Bruce said that, in his opinion, the decision of the magistrate was right. The principle to be derived from the cases which had been cited was that, where land or houses abutted upon a new street, then the person who received the rent or who would do so, if it were payable, was the person who was liable to contribute to the expenses of making up the roadway. Mr. Justice Phillimore gave judgment to the same effect.

London County Council Building Regulations.—At the Surveyors' Institution, Westminster, last week, the Tribunal of Appeal, consisting of Mr. Arthur Cates (chairman), Mr. J. W. Penfold and Mr. A. A. Hudson, heard an appeal by Messrs. Pink, Fryer and Co. Mr. Freeman, in opening the case, said the appeal was against the refusal of the County Council to pass the plans of the appellants for a site at the corner of West End Lane and Thorney Road, South Hampstead. He contended that the building which they proposed to erect was not in Thorney Road, but in West End Lane, and was a continuation of the buildings already being built there. He quoted the case of *Barlow* v. *Vestry of St. Mary Abbott's, Kensington*, where the House of Lords had decided that the premises at De Vere Gardens were in Kensington Road, and not in De Vere Gardens, and the premises were allowed to project about 7ft. beyond the building line of De Vere Gardens. Mr. Wallace said that by section 22 of the London Building Act the superintending architect of the County Council was to have the sole decision as to the building line of any street; and he contended that the premises of the appellants were really in Thorney Road, where the building line must be the line of the existing houses. The chairman said, as the point in question was important, they thought it desirable to consider their judgment.

The Sale of Building Plots.—In the Queen's Bench Division of the High Court of Justice on January 12th the case of *Maloney* v. *Mallet* was heard. The plaintiff was the owner of a building estate at Fambridge, in Essex, and at a sale by auction on August 8th last the defendant purchased certain of the plots of this estate from the plaintiff at the price of £271 10s. After the auction the defendant signed the memorandum of agreement of purchase, but did not pay any deposit. The plaintiff now sought to recover the whole of the purchase-money; and though in effect it was an action for specific performance which ought to be brought in the Chancery Division, yet owing to the special conditions contained in the memorandum of agreement the plaintiff was entitled to recover the money in the Queen's Bench Division. Counsel referred to the special condition and stated that it had been specially drawn to enable the purchase price to be recovered otherwise than by an action for specific performance. The defendant had signed the stipulation that he wished to have a free conveyance and to pay the balance of his purchase-money by instalments on the terms of the conditions in the said memorandum of agreement and so came within one of the conditions (No. 10). Mr. Justice Bruce said that strictly the plaintiff was entitled to judgment for the whole amount of his claim; but he suggested a settlement as the defendant was in rather a hard position. Mr. Montague Shearman said the plaintiff had only brought the action to give the defendant a lesson, for all the expenses of the auction had been thrown away. The plaintiff did not desire to press the case and would be satisfied by the rescission of the contract and the defendant paying in cash his taxed costs. The defendant, who appeared in person, agreed to the offer. Mr. Justice Bruce then gave judgment for the plaintiff for £50; the contract to be rescinded.

Concerning the Increased Cost of Materials.—At the Loughborough County Court recently, John Perkins, a plumber, sued Arthur Faulks, a builder and contractor, for £40 6s. 8d., balance of account for work done and materials supplied at the Falcon Works, Loughborough. The sum of £13 5s. 4d. had been paid into court in respect of items in the account admitted by defendant, and the balance in dispute was £27 1s. 4d. The circumstances under which the action was brought were as follows:—Defendant was contractor for works for the Brush Electric Engineering Co., and plaintiff was a sub-contractor for the lead work. Plaintiff told defendant that owing to the unsettled state of the lead market it was necessary that he should know how long the work would take, and defendant told him it would be a nine or ten months' job. Plaintiff then obtained a contract for the supply of lead for a period of twelve months to cover the period named. He commenced work in June, 1898, and continued till December of that year, and then he was stopped because defendant was going on with other works. This job was not resumed till January, 1900, and then plaintiff pointed out that the price of lead had increased by £4 a ton, and he could not go on with the contract on the prices originally scheduled. Defendant told him the architects would make that right, and he went on with the work. The scheduled price was 17s. per cwt., and plaintiff had to pay 21s. for the lead used in completing his work after the resumption of this particular job, and he claimed to recover only what the lead had actually cost him after the expiration of the time fixed by defendant.—After some discussion his Honour amended the particulars of the claim, making it an action for damages, consequent on defendant preventing plaintiff completing the contract on the terms originally agreed upon.—Defendant's solicitor submitted that as plaintiff elected to resume the execution of the contract after the delay, he did so on the terms originally agreed upon. Defendant said that when he was negotiating with plaintiff no time was mentioned for the completion of contract No. 1. When the work on that was stopped, plaintiff was given work to the amount of about £1,500 on other works.—His Honour expressed surprise that such a case should have been brought into court, and still more that the parties had not agreed to refer it to someone for settlement. It was unreasonable for the defendant to hold plaintiff to the price he quoted at first, having regard to the fact that defendant had to put off completing the work to suit the convenience of the building-owner. Plaintiff was, therefore, entitled to damages, and though he might have saved some of the loss by getting a larger quantity, it was not possible for him to avoid some loss. Judgment would be for £17, and the £13 5s. 4d. paid into court.

Definition of "A Public Building."—The case of *Moses* v. *Marsland* was heard last Thursday in the Queen's Bench Division of the High Court of Justice. This was an appeal from the decision of a metropolitan magistrate making an order against the appellant ordering him to comply with a notice served on him by the respondent, who is the district surveyor for Camberwell, under the London Building Act, 1894, requiring him to do certain things under the provisions of that Act whilst carrying out alterations for the managers of the Metropolitan Asylums District at No. 16 Elmgrove, Peckham. This building had been an ordinary detached dwelling-house of two floors, with one room and a basement below, and had been purchased by the managers; and they had instructed the appellant under the supervision of the Board's architect to so alter the building as to make it suitable for the accommodation of 12 to 14 imbecile children and a matron, cook and housemaid. The total cubical capacity of the dwelling-house was under 50,000 cubic feet. The question before the magistrate was whether the building in the above circumstances was a "public building" within the London Building Act, 1894, sections 5 (27), 68 and 79. The magistrate held that the building was, in the hands of the managers of the Metropolitan Asylums District, used, or constructed, or adapted to be used for a public purpose, and made the order asked for by the respondent in regard to the staircase, height of rooms, &c. The Court allowed the appeal. Mr. Justice Bruce said that he was of opinion that the building in question was not a public building within section 5 (27) of the London Building Act, 1894. He did not agree with the contention that the building was a hospital. No doubt the word hospital originally had a very wide meaning and meant any place of lodging; but in modern times it was used to signify a place for the treatment of the sick or infirm. The building in question could not be considered as a hospital in that sense. Nor was the building within the section on the ground that it was a building used for "any other public purpose." The substance of the decision in *Josolyne* v. *Meeson* was that the phrase "public purpose" indicated, not a place in which the public had an interest, but one where they could gain admission. Apart from that, a building used "for any other public purpose" must be one used for a purpose *ejusdem generis* with those of the enumerated buildings, and would not include a house used for the purpose described in the case. The building did not come within the term "home" because it had not a cubical capacity of 250,000 cubic feet or sleeping accommodation for 100 persons. The magistrate therefore came to a wrong conclusion, and the appeal must be allowed. Mr. Justice Phillimore said that in his opinion the building was not a hospital in the modern sense of a place for treating physical ailments. The Local Government Board and the Metropolitan Asylums Board had anticipated the provision of the Elementary Education (Defective and Epileptic Children) Act, 1899, and had provided houses for the reception of children who were incapable of being associated for the purposes of education with ordinary children as an adjunct to schools where special arrangements were made for the education of such children. The children placed in these houses were there for the purposes of education, and not for treatment. The houses were therefore in no sense hospitals. He was also of opinion that the building did not come within the words "building used, &c., for any other public purpose." These were not perhaps the best words to have used. But they were the words which were used in the former Act dealing with the subject, and as they had received judicial interpretation in *Josolyne* v. *Meeson* they were introduced into the Act under consideration. The words did not include every building used in the public interest, but only buildings used for purposes which involved the admission of the public, as, for instance, a public lecture-hall, where every member of the public who paid the entrance money was admitted. He was therefore of opinion that the building in question did not fall within the terms of the section, and that the magistrate's decision was wrong.

The new Military Hospital which is to be built on the southern slopes of Portsdown Hill, Portsmouth, is to be named the "Alexandra," after the Princess of Wales, who, it is expected, will lay the foundation-stone. The building is intended to replace the station hospital at Portsea.

Correspondence.

Use of Centrolinead for Perspectives.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—While writing my reply referred to by Mr. Ramm (see page 438 of issue for January 9th) I had Mr. R. Phené Spiers' description before me, but did not refer to it because he recommended setting the centrolinead by trial, whereas I wanted a direct method without any guessing. Mr. T. H. Griffiths' method seems to be correct and the best that has yet appeared, requiring only a little neat drawing to obtain the angles for setting the instrument without calculation.

Your correspondent R. W. Sampson must be a very careless reader. In his previous criticism of my first letter he made a misstatement as to its contents, and now he makes another misstatement when he says "according to Professor Adams' first answer Mr. Nicholson was indebted to Mr. Bryan for an explanation of how to use his (Mr. Nicholson's) instrument." No such statement was made by me, and it is highly probable that Mr. Nicholson died before Mr. Bryan was born. Your correspondent does not give one the impression that he received as much profit as he should have done from his early opportunities. He finds fault with Mr. Griffiths for not stating "how the positions of the pins or studs on which the arms work are determined." Now there is so much range possible in these positions that they require no determination beyond what is stated by Mr. Griffiths, and may be from 12in. to 18in. apart with equal accuracy; and whether the vanishing point is 20ft. off the board or any other distance, Mr. Griffiths' method is equally applicable. But, after all, what does R. W. Sampson want? He *knows how to set the instrument and fix the pins with the simple aid of a set-square*, but does not "feel at liberty to divulge" the secret. Then why ask how to do it? It reminds one of the recent controversy on the Maskelyne box trick, and a continuation of the correspondence would be as little profitable to those now concerned.—Yours truly,

HENRY ADAMS.

[This correspondence is now closed.—ED. B. J.]

Professional Practice.

Enniskillen.—The new Town Hall was opened recently. It is situated on the Diamond, an elevated portion of the island on which the town is principally built, and the cost of its erection amounted to a sum of about £11,000. The building is erected in the Renaissance style, freely treated, and the area which it covers is 9,070 sq. ft. Limestone from the local quarries has been used in the construction of the walls, together with a supply of brick, and the exterior is faced with punched stone, from the Carra-Creagh quarries, which are situated on the shores of Lough Erne. This stone, after careful examination and comparison, was selected on account of its enduring qualities, and it has been worked out in a solid and substantial style. Dungannon chiselled sandstone has been used in the mouldings, pilasters, columns and cornices. The main entrance from Townhall Street is flanked by pilasters and columns supporting an ornamental balcony, which is reached from the corridor on the first-floor level, and surmounting the building is a tower containing four angled turrets terminating in a dome with finials, &c. The interior of the building is well fitted up. On the basement floor there are caretaker's apartments, and advantage has been taken of an inclination in the site to arrange them principally overground. Provision has been made for cooking for public banquets, and there are also a store-room and an engine-room containing all the fire brigade appliances. On the ground floor there are two entrances, the main one being in Townhall Street, and a side one in Water Street. The latter is intended for use on occasions when there is a likelihood of a big crowd desirous of obtaining ingress or egress. The main entrance is flanked by the Town Clerk's office and the chairman's parlour on one side, and by a reading-room and a book store on the other. From the clerk's office on the left of the entrance there is a flight of stone stairs leading to the strong room in the basement of the tower, and there is communication through the chairman's parlour with the Council Chamber. A minor hall, 35ft. by 31ft. occupies a portion of the structure facing Water Street, and is fitted with a movable platform. Off this hall there is a large committee-room divided by movable partitions. Over the suite of municipal offices there is the Assembly Hall, which is reached from the ground floor by a staircase of ample width. This room has a floor area of 2,925ft., is 29ft. high, and is entered by four doors running along the corridor. Where possible fire-proof materials have been used. Messrs. Anthony Scott and Sons, of Drogheda, Navan, and London, were the architects, their plans having been selected in open competition, and placed first by the assessor, Sir Thomas Drew, P.R.H.A., P.R.I.A.I. The general contractor was Mr. James Harvey, Enniskillen. Messrs. Musgrave and Co., Belfast, supplied the heating apparatus. The stone carving was executed by Mr. Harte, of Brookeborough. The designs for the building were illustrated in our issue for October 12, 1898.

London.—A Roman Catholic Church has been built entirely by pauper labour in the Marylebone Workhouse. The little chapel was found too small for the congregation, and the guardians resolved to provide a larger one. Two of the principal wards in the same block as the old chapel were set apart for the purpose, and pauper labour set to work upon it about three months ago. The two wards were knocked into one, the erection of the high altar, the making of the pedestals for the statues of SS. Joseph and Mary, the altar rails, the placing of the brasswork, the framing and hanging of the Stations of the Cross, the whole of the decorative work around the walls, and even the fixing of a stained-glass window at the rear of the altar, representing the "Descent from the Cross" and scenes at the Crucifixion, were all done by indoor poor.

Plymouth.—New buildings have been added to the Plymouth Institution. They consist of a reading-room, library, and other rooms. The additional buildings are lighted on to the Crescent. While there are separate entrances, the new portion may be approached direct by a staircase leading from the museum of the Institution. The new buildings have been designed by Mr. A. S. Parker, A.R.I.B.A., George Street, Plymouth. Competitive plans were invited from architects, and Mr. Parker's were selected from a large number. The front is treated in the Grecian style of architecture, in continuation of the style of the original building, which was designed by Mr. Fulston, architect, of Plymouth, in the early part of the past century. The front of the reading-room has a curved circular bay up to the cornice level, and contains three large windows in the lower part, and a peristyle of dwarf Doric pillars in the upper part, with six small windows between to light and ventilate the upper part of the room within. The entrance is adorned with fluted Doric columns on either side of a recessed portico. The entrance doors are wide, with bevelled-edged square plate panels. They lead into a spacious, well-lighted entrance hall, 18ft. square, the staircase hall and alcoves for the display of antiquities branching therefrom. The hall floor is on a level with the museum gallery, and there is a circular junction with the old buildings at the north-west corner. The reading-room is 30ft. by 24ft., and 18ft. 6in. high, fitted with electric lamps on wrought-iron brackets and drops. The new library, 33ft. 6in. long, by 24ft. 6in. wide, and 24ft. high, has a stained open roof, with lantern. The room is fitted with book-cases in characteristic style. The fittings of the room are most appropriate. A council room leads from the hall and library. Opposite the entrances the main staircase leads to the ground floor of the museum, this forming the main connection between the new and the original buildings. Ladies' and gentlemen's cloak rooms and a photographic dark room complete the accommodation of the extension. The building and fittings have been carried out by Mr. G. P. Turpin, contractor, of Plymouth, and the heating apparatus, both for the old and the new buildings, have been fitted by Mr. W. T. Hocking, while the electric-lighting has been carried out by Mr. W. E. Heath, both of Plymouth.

New Patents.

These patents are open to opposition until February 28th.

1899.—Cable Conduits.—25,216. G. E. HEYLDIA, 55 Market Street, Manchester. The conduit consists of a composition of india-rubber and pitch moulded, drawn or pressed into the required shape and length. The advantages are that the conduit will readily follow a bend in the ground, is waterproof, and avoids the numerous joints now required with earthenware.

1900.—Fireproof Floors.—2,740. A. W. GREEN, The Glen, 35 Gorst Road, Wandsworth Common, London, S.W. The floor consists of terra-cotta lintels supported between the girders or joists, the upper side being filled in with concrete and the lower surface plastered. Longitudinal dovetail grooves are formed on both sides of the lintel in order to afford a good "key."

Humidifiers and Ventilators.—3,227. G. B. PYE, 63 Dewhurst Street, Blackburn. The object of this invention is to supply air warm or cold, humid or dry. The device consists of a series of troughs filled with water, which, by capillary attraction, is distributed over a fabric through which the air is drawn by means of a fan, being afterwards deflected by plates or distributed by pipes as desired. The troughs are provided with steam pipes so that the water may be heated and the humid air consequently warmed.

Calculating Device for Girders, &c.—5,142. W. DOHM, Bielefeld, Prussia. This invention relates to an apparatus for calculating the size of joists or columns to support certain loads. It consists of a semicircular piece of brass or other material marked on one side with concentric load scales for certain safe limits of stress; a base part with scales for lengths of structure and distances of loads; and a lever pivoted on the base part and having on its front side scales for sizes, moments of inertia, &c. Means are provided for holding the semicircular part and the lever in any position. A sliding rule is also employed.

Cutting Wood on the Twist.—9,314. E. H. HOPTON, Union Works, Market Harborough, Leicestershire. By means of an arrangement of ropes or chains, the saw table is made to oscillate and to draw the wood towards and away from the band saw. The wood is carried on a radial arm set to the required radius, each piece being sawn to the desired sweep without any template or marking being necessary.

Hand Street-Sweepers.—12,816. W. H. H. MILLER, Williamsport, Lycoming, Pennsylvania, U.S.A. The machine consists of a large rotary brush at the back, two small wheels at the front, and a movable apron between adapted to direct sweepings into a pan. The whole arrangement resembles a lawn mower.

Concrete Piles.—18,950. O. HOFF and C. F. HAGLIN, both of Lumber Exchange, Minneapolis, Minnesota, U.S.A. The pile is made of concrete, and has a metal core extending longitudinally through it, with a number of binding braces. Hollow metal pipes are also provided, running the whole length of the pile, to supply water to the lower end during sinking operations; or the centre core may be arranged in this manner, thus serving a double purpose. It is claimed that these piles are very strong and easily driven.

Jointing Sanitary Ware and Metal.—20,921. M. J. ADAMS, Park Lane Sanitary Works, Leeds. An indent is formed on the body of the article (say, a closet) to be jointed, near the end, and around it is wound some wire, or a metal band

is fixed. The socket of the pipe can then be attached to this wrapping with solder.

The following specifications were published on Saturday last, and are open to opposition until March 7th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1900.—33, MEHRTENS, manufacture of hollow grate-bars. 286, SPENCE, travelling cranes. 2,063, SUGG, apparatus for incandescent gas lighting. 2,482, FRY, inking devices of stencilling apparatus. 2,513, DICKINSON, DUFFIELD, AND SCARLETT, picks and combinations of other tools therewith. 2,938, CLIFTON, saw-sharpening machines. 3,584, BRIGGS, method for utilising the waste heat from brick and other kilns. 3,699, BARR, hydrant and similar valves. 3,717, LITTLE, traps for water-closets and drains. 3,745, MESSER, acetylene gas generators. 3,868, BRUCE, stench and other syphon traps. 4,063, MACKENZIE, gripping devices of overhead, travelling and other cranes. 4,076, POCHIN AND POCHIN, crushing and grinding machinery. 10,333, WILLMORE, pavement lights. 13,626, FEIG AND DAMME, staircase steps. 15,395, STOTT, apparatus for heating a large quantity of water, such as for swimming baths. 15,396, STOTT, appliances for valves of water-heaters. 17,025, PREDMERSZKY AND PREDMERSZKY, acetylene gas generator. 18,286, FAUCK AND FAUCK, rig for boring wells. 19,016, RAILSBACK, acetylene gas generator. 19,935, LAKE (*The W. & E. T. Fitch Co.*), window-sash fasteners. 20,683, KNOWLES, BARKER AND DEAN, expansion pulleys. 20,970, JORDAN, crushing machines. 21,209, DAVEY, PAXMAN AND CO., LTD., AND KING, pumps. 21,458, MILLS (*Bondi & Chinn*), water-closets. 21,574, DAVIES, pick. 21,889, SCHMALTZ, saw-sharpening machines.

Keystones.

An Astronomical Observatory in Dundee is proposed to be erected.

New Baths at Kentish Town are being erected in Prince of Wales Road, and will be opened at the end of next June.

The Priory Park Board Schools, St. Albans, are being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Mr. John Burnet, F.R.I.B.A., I.A., architect, of Glasgow, died last week at the age of 87 years. He was head of the firm of John Burnet and Son, St. Vincent Street, and was an architect of distinction; he designed many important buildings in Glasgow and the West. Associated with him in the business was his son, Mr. John James Burnet, A.R.S.A.

The Hospital of St. John and Elizabeth at St. John's Wood has been rebuilt and enlarged from designs by Mr. E. Goldie, of Upper Phillimore Place, Kensington. A noteworthy part of the scheme has been the transference and re-erection, stone by stone, of the church built by Sir George Bowyer in Great Ormond Street as a central and conspicuous feature of the new building. The hospital is capable of accommodating 100 patients, male and female. The price paid for the site was £13,000, and the estimated cost of the new building is £45,000. The building was illustrated in our issue for December 14th, 1898.

Fitzgeorge Avenue, West Kensington, was formally opened by the Lord Mayor of London last week. The new street has been designed by Mr. Delissa Joseph, F.R.I.B.A., and built by Mr. Henry Lovatt. The avenue is 50ft. wide and about a quarter of a mile long. It is to be lined on both sides with blocks of residential flats, most of which are completed. The blocks differ from each other both in plan and in design, and have large entrance courtyards. The designs are based upon Classic forms and the monotony of continuous rows of buildings has been avoided. The materials used are red brick and stone.

A Memorial Window to the memory of Principal Caird has been erected in the Bute Hall of Glasgow University.

A new Board School, erected by the School Board for London in Invicta Road, Westcombe Park, has been opened. The school holds over 900 children.

A Marble Bust of Hogarth is to be given by Mr. Passmore Edwards to the new Chiswick Town Hall, which is in the district where he lived and worked.

The Wolverhampton Exhibition.—It is probable that Russia will be represented at the Wolverhampton Exhibition of 1902 by exhibits illustrating her natural resources and industrial development.

New Public Baths for Chelsea.—The Chelsea Borough Council have decided to pull down the present public baths, and to utilise the existing and adjoining sites for the erection of new baths, which will cost, roughly, £70,000.

"Architectural Reviews" Wanted.—In exchange for a copy of the "Architectural Review" for December, 1898, the publisher will be glad to send the "Builders' Journal" post free for eight weeks, or a copy of the current issue of the "Review."

Messrs. Briggs and Wolstenholme, architects, of Blackburn, who, with another firm, were successful in the Liverpool Dock Board Offices scheme, are amongst the four selected in the preliminary competition to provide plans of the new Bluecoat School at Wavertee.

A new Church for St. John's, Hopwood, is proposed to be built at a cost of £2,300. The architect is Mr. Oakley whose plans show the church consisting of a nave, a chancel, and one aisle, with accommodation for about 200 people. An extra aisle to seat 200 people could be added when funds permit.

A new Edinburgh Asylum.—The Commissioners of Lunacy have had before them the plans by Mr. Hippolyte J. Blanc of the new asylum at Bangour. On several points they found fault with the plans, particularly in respect of the expense that was being lavished upon them. In the case of the doctor's house, which was set down at an estimated cost of £7,500, they insisted that a reduction must be made. Some of the architectural adornments of the building, too, were found fault with as causing unnecessary expense.

Metropolitan Asylums Board.—At last week's meeting the tender of Messrs. Dawson and Co., Ltd., of Stalybridge, amounting to £4,416, for carrying out the necessary wiring works in connection with the electric-light installation at the Tooting Bec Asylum (in accordance with the plans and specification prepared by the consulting engineers, Messrs. Handcock and Dykes) was accepted. The following recommendation of the Works Committee was also agreed to:—"That, subject to the sanction of the Local Government Board, the amended tender of Messrs. Veale and Carter, of Mill Lane, Brixton Hill, for alterations and other works to be carried out at Rochester House, Little Ealing, in accordance with the plans and revised specification prepared by the surveyor to the Board, at the sum of £2,999 0s. 8d. net, be accepted, and that the seal of the Board be affixed to the contract."

The Boadicea Group, to be placed on the Embankment at the west end of Westminster Bridge shortly, is generally believed to be the work of Mr. W. Hamo Thorneycroft, R.A. This is a mistake; the sculptor of the Boadicea is Mr. Hamo Thorneycroft's father, Mr. Thomas Thorneycroft, an artist whose strongest bent was towards mechanical engineering. His work in sculpture—which included the equestrian statue of the Queen at the 1851 Exhibition, Charles the First in Westminster Hall, and the equestrian statues of the Prince Consort at Liverpool and Wolverhampton—was much less in bulk than that of his wife, herself the daughter of a sculptor, John Francis, who brought her up to his own profession. Mary Thorneycroft executed a long series of busts and statues, chiefly of the Royal children, for the Queen, who always regarded her work with affectionate admiration.

The Portsmouth Technical Institute Competition.—Mr. Cross, of London, the assessor has awarded the £100 premium to Mr. C. E. Smith, of Victoria Road North, Swansea, the £75 premium to Messrs. Rake and Cogswell, of Prudential Buildings, Langport, and £50 to Mr. W. C. Bevis, of Elm Grove, Southsea. The other competitors were Messrs. A. E. Guy, of Albert Road, Swansea; C. Ball, of Kent Road, Southsea; and J. W. Walmsley, of King's Terrace, Southsea.

Proposed Baths for Swinton.—The Building and Sanitary Committee of the Swinton and Pendlebury Urban District Council had six competitive plans before them last week for the proposed baths to be erected for the district off Pendlebury Road, Swinton. The Council have offered a prize of £50 to the architect submitting the approved plans. Sub-committees were appointed to report on the six plans submitted to the Council. It is hoped that building operations will be commenced during the spring of the present year.

The Competition at Bridlington for the extension of the Royal Prince's Parade has been decided in favour of Messrs. Mangnall and Littlewood, architects, of Manchester, who have obtained the 35 guineas first premium. Mr. J. Freebairn Stow, Corn Exchange, Uxbridge, was placed second. The premiated plans provide for the extension of the parade and the construction of an iron pier and promenade, with a pavilion to accommodate 3,000 persons, the estimated cost being about £28,000.

The Royal Institute of Architects of Ireland held a meeting last week, when it was decided to form an organisation in Ulster for the promotion of union and integrity amongst its members, with constitution and by-laws subject to the approval of the Institute, to which it will be affiliated. Messrs. Vincent Craig, F.R.I.B.A., J. J. M'Donnell, J.P., Frederick H. Tulloch, A.R.I.B.A., William J. Gilliland, John C. Dewhurst, A.R.I.B.A., with Nicholas Fitzsimons, A.R.I.B.A., as secretary and convener, were appointed a provisional committee to prepare a scheme for the new society and to report to a general meeting of the Institute.

The Glasgow Exhibition Buildings.—About 70 students of the Glasgow High School Building Construction Classes, under Mr. D. Bennet Dobson, recently visited the buildings of the Glasgow International Exhibition, 1901. The party were conducted through the various buildings by Mr. White, clerk of works. Commencing at the Industrial Hall, the Indian and Burmese Sections were first visited. The exit close by gave a demonstration of the automatic arrangement of the revolving shutters. The main roof of the Industrial Hall has a span of 103ft., and it is designed on the three-hinged principle, so as to counteract any evil effects that might be caused by expansion and contraction of the metal. The feet of the trusses are supported by steel pins, fixed to bed plates, which are securely bolted to the concrete foundations, the other pin being at the centre of the truss near the ridge. The party then visited the dome, which is 80ft. in diameter and 190ft. high. Instead of being supported by the steel piers which were originally intended to carry it, steel being so difficult to obtain at the time, timber was adopted for the construction of the four massive L-shaped piers. The company then passed down the Grand Avenue, which is 1,000ft. long by 75ft. broad, and curved on plan. The roof, rising to a height of 40ft., is formed of semi-circular laminated ribs, 15ft. centre to centre. The central portion of the ribs is in three thicknesses of timber, while the ends are in five thicknesses. The bridge across the Dumbarton Road is on the cantilever principle, the cantilevers being supported on cast-iron columns, and the necessary back-weight obtained by large concrete blocks. The Machinery Hall, next visited, covers a large area, and is roofed by five roofs, a central span of 108ft. being bridged by elliptical-shaped trusses, supported at intervals of 8ft. by double columns, and the space between these again spanned by curved lattice girders. Two roofs of timber construction flank either side.

The Excavations in the Roman Forum have just revealed the fact that the Christian basilica recently unearthed on the Palatine was the residence of the Popes in the eighth century.

New Municipal Offices at Keighley were opened yesterday in Bow Street. Mr. John Haggas has prepared the external and Messrs. J. B. Bailey and Son the internal plans, and the cost has been £10,000.

The Leeds Art Pottery and Tile Company, Limited.—We learn that this company, which recently liquidated, is now the same in name only. The concern has been re-registered, with a new Board of Directors, and is being carried on with every prospect of sound and successful business. The former managing director is no longer connected with the company in any way, but the directors are thoroughly practical and experienced men, whose commercial experience and financial standing are guarantees for the future of the company. The lack of sufficient capital no doubt led to the embarrassments of the old company, but there will be no such drawback with the new one. The architectural work recently executed includes the offices of the National Telephone Company on the Embankment, the District Provident Society, Manchester; Hotel Metropole, Leeds; Sheffield Banking Company, Sheffield; and many other buildings in various parts of the country. The company is also carrying on with energy and care the department of pedestals and vases, upon which the reputation of the old company was largely founded. The retention of the services of Mr. R. C. Browne ensures a continuity of style and quality of material.

COMING EVENTS.

Wednesday, January 23.

RUSKIN SOCIETY OF BIRMINGHAM.—Mr. Lionel Cust, M.A., on "Portraits as Historical Documents," 8 p.m.

CONTRACTS OPEN.

ST. GEORGE'S (Hanover Square) UNION, London.

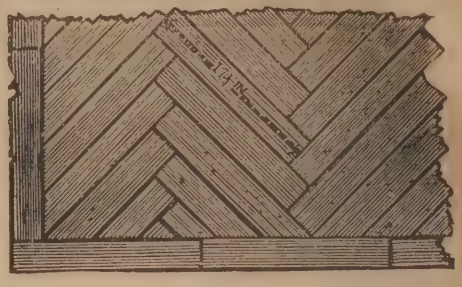
The Guardians are prepared to receive TENDERS for the ERECTION of a CHILDREN'S HOME in Milman Street, Chelsea, to be erected from the designs of Mr. Edwin T. Hall, F.R.I.B.A., Architect, of No. 57 Moorgate Street, E.C. Builders desirous of Tendering can obtain bills of quantities, conditions of contract, form of Tender, &c., from the Architect, upon paying a deposit of Three Guineas, which deposit will be returned on receipt of a bonâ-fide Tender. Copies of the drawings may be inspected at the Architect's offices after the quantities are sent out.

Tenders to be delivered to the undersigned not later than MONDAY, the 11th day of FEBRUARY next. The Guardians do not bind themselves to accept the lowest or any Tender.

THOMAS WORLOCK,
Clerk to the Guardians.

DARLINGTON SCHOOL BOARD.
TO BUILDERS AND OTHERS.

Persons desirous of TENDERING for the whole or any portion of the various works required to be done in the ERECTION and FINISHING of a MIXED SCHOOL for 420 children, also an INFANTS' SCHOOL for 270 children, including boundary walls, wrought-iron pallisading, gates, fencing, &c., at Rise Car, Darlington, may inspect the drawings, specifications, and conditions of contract, and obtain bills of quantities and forms of Tender at the Offices of the Architect, Mr. G. GORDON HOSKINS, F.R.I.B.A., Court Chambers, Darlington, from WEDNESDAY, JANUARY 23rd, until MONDAY, FEBRUARY 4th, both dates inclusive.



Tenders, endorsed "Tender for Rise Carr Schools," to be addressed to me, and delivered at my Offices before ELEVEN a.m. on TUESDAY, FEBRUARY 5th, 1901.

N.B.—No pledge is given to accept the lowest or any Tender.

By order,
F. RAYMOND STEAVENSON,
Clerk to the Board.

School Board Offices,
Houndgate, Darlington,
January 1901.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
	BUILDING.		
Jan. 25	Glasgow—Hospital	Parish Council	Thomson and Sandilands, 241 West George Street, Glasgow.
„ 25	Branksome, Dorset—Repairing, &c., Police Station	Standing Joint Committee	County Surveyor, County Council Offices, Sherborne.
„ 25	Dungeness, Kent—Coastguard Buildings	Admiralty	Coastguard Watch Room, No. 2 Battery, Dungeness.
„ 25	Coventry—Post Office	H.M. Commissioners of Works, &c.	Postmaster, Coventry.
„ 25	Bexhill, Sussex—Sessions Court	East Sussex County Council	F. J. Wood, County Surveyor, County Hall, Lewes.
„ 25	Gortlettera, Mohill, Co. Leitrim—Alteration to Church	Very Rev. J. Maguire, P.P.	Hague and M'Namara, 50 Dawson Street, Dublin.
„ 25	St. Mawes, near Falmouth—Coastguard Buildings	Admiralty	Director of Works Department, 21 Northumberland Avenue, W.C.
„ 25	Barrowford, Lancs.—Wall	Urban District Council	Council Offices, Barrowford.
„ 25	Preston, Lancs.—Classroom		T. Nevett and Sons, 41 Fishergate, Preston.
„ 25	Shillelagh, Ireland—Dwellings	Rural District Council	Council Offices, Workhouse, Shillelagh.
„ 25	Whicham, near Silecroft—Church Restoration		Austin and Paley, Architects, Lancaster
„ 26	Castleford—Premises	E. Binks	Garside and Pennington, Architects, Pontefract.
„ 26	Falkirk—Extension		D. Ronald, Burgh Surveyor, Burgh Chambers, Falkirk.
„ 26	St. David's, Pembrokeshire—School Buildings	St. David's County School	D. E. Thomas, Architect, Haverfordwest.
„ 26	Briton Ferry—Public Library and Council Offices	Urban District Council	H. A. Clarke, Council Offices, Briton Ferry.
„ 28	Erith, Kent—Board Offices and Cookery Centre	School Board	Ford, Son and Burrows, 21 Aldermanbury, E.C.
„ 28	Dublin—Artisans' Dwellings	Corporation	C. J. M'Carthy, Architect, Municipal Buildings, Cork Hill, Dublin.
„ 28	Penarth—Bandstand, Shelters, &c.	Urban District Council	E. J. Evans, Surveyor, Council Offices, Penarth.
„ 29	Croydon—Engine-house	Town Council	Deputy Borough Engineer's Office, Town Hall, Croydon.
„ 29	Middlesbrough—Pulling down	Yorkshire Banking Company	Bedford and Kitson, Greek Street Chambers, Leeds.
„ 29	Sheffield—Destructor Buildings		C. F. Dike, City Surveyor, Town Hall, Sheffield.
„ 29	Dartford—Fire Station and Cottage	Urban District Council	W. Harston, Surveyor, High Street, Dartford.
„ 30	Swanley, Kent—School for Children	Metropolitan Asylums Board	Newman and Newman, 31 Tooley Street, London Bridge, S.E.
„ 30	Tredegar, Mon.—Chapel, &c.	Primitive Methodist Church	W. S. Williams, Elmwood, Tredegar.
„ 30	Southwick—Additions to Schools	School Board	Clayton and Black, 152 North Street, Brighton.
„ 30	Pudsey—Five Houses		C. S. Nelson, Architect, Sun Buildings, 15 Park Row, Leeds.

THE BUILDERS' JOURNAL & ARCHITECTURAL RECORD

JANUARY 30, 1901.
No. CCCXII

EFFINGHAM HOUSE,
ARUNDEL STREET,
STRAND, W.C.

In Memoriam.

A SILENT figure crossed the portal of the Hall of Many Monarchs and stood on the girdle of the earth. An expectant world was hushed to hear his voice. "The Queen is dead," he cried, and the winds took up his cry and carried it o'er mountains and hills, o'er rivers and valleys, to the uttermost ends of the land; whilst lightnings flashed the sad news from sea to sea. The sky was darkened, and amid the thunders of celestial drums, which beat out their mournful music with resistless melancholy, the people lay benumbed with grief. For Victoria the Well-Beloved was the greatest of great queens, a wise and sympathetic ruler, a gracious sovereign, a good mother and a pious woman. Her Court was free from those associations and habits which debase a Court, and her Ministers' actions were strongly influenced by the nobility of her character. But the most beautiful feature in her great and illustrious career was perhaps the manner of her private life: no royal scorn here for the simple and the humble, no feverish straining after petty pleasures, but an ever-ready hand to help the needy, and a heart in tune with the desires of her people—hers was the individuality of a good woman. Now the feeble spark of life is passed beyond the pale of earthly things, across the Mystic Border-line betwixt Humanity and the Great Hereafter. All homes throughout the length and breadth of the land are darkened by a great cloud of sadness, and a nation awaits with silent reverence the mighty pageant of Victoria's funeral: that day shall be historic when the dead monarch shall be slowly borne away from the shore of her little sunny isle, borne between the symbols of her wondrous puissance, walled in on either side by the mighty leviathans of many Powers: then to Britain's capital, where the silent people shall view, bareheaded, the corse and cortège pass: and finally to the royal resting-place, where the great Queen shall be laid in peace, beside the Consort she loved so well. To quote those well-known lines of Tennyson:

> Her court was pure; her life serene;
> God gave her peace; her land reposed;
> A thousand claims to reverence closed
> In her as Mother, Wife and Queen.
>
> And statesmen at her council met
> Who knew the seasons when to take
> Occasion by the hand, and make
> The bounds of freedom wider yet.
>
> By shaping some august decree,
> Which kept her throne unshaken still,
> Broad-based upon her people's will,
> And compass'd by the inviolate sea.

The book is closed and the last page is stained with a people's tears. Now a new book opens, one bright with hope and illumed by the traditions of a glorious past. May Edward VII. tread the royal path that lies before him with as firm a purpose as his illustrious mother; may he emulate her virtues, carry on her great work, and wield the sceptre of government with an equal wisdom, ever keeping before his eyes those principles of truth and duty which made the reign of Victoria the Well-Beloved so glorious and so honourable.

The Royal Mausoleum.

THE mausoleum at Frogmore was built by Her Majesty in 1862 as a fitting shrine for "Albert the Good." It stands in Windsor Park, well within sight from the South Terrace of the Castle, but it is never open to the public. Only on December 14th, the anniversary of the Prince Consort's death, after the memorial service for the Royal Family had been held, was it the custom of the Queen to permit the families of the Royal tradesmen at Windsor, and a few other privileged persons, to view the interior. The general appearance of the building, and its beautiful surroundings of forest trees and deciduous shrubs, may be gathered from our illustration. It is built of Portland stone and Aberdeen granite, its superstructure based on a massive foundation of brick vaulting, especially designed, with numerous air-holes to ensure ventilation and to avoid damp. The mausoleum is constantly warmed, but the site is an exceedingly damp one, and not all the lavish care bestowed upon the building has served to prevent some injury, owing to the moist nature of the ground. The building, which on plan is like a Greek cross, was designed by Mr. Humber and Professor Grüner, names which carry no meaning to the majority of persons nowadays, and the contractors were Messrs. Dines and Co., of Pimlico. From first to last a sum amounting almost to a quarter of a million sterling has been expended here in the building and its decoration. The octagonal tower, springing from the centre of the cross, is conspicuous in winter time from the Long Walk, its copper roof turned to a brilliant green by the action of the weather. Its height is 83ft., the whole of the building 70ft. square. Mounting the steps, and reaching the terrace on which it stands, the entrance is gained through a triple arcade, supported on columns of Cornish granite. Immediately in front, over the doorway, is a bronze tablet with an inscription in Latin to the effect that this sepulchre was erected to Prince Albert by "his mourning widow." Elaborate brass gates conduct to the eastern arm of the cross, and open up a view of a great central blue dome, spangled with golden stars, beneath whose canopy light comes through the windows in each of the eight faces of the tower. Directly under the dome, resting on an inlaid floor of polished marble and a black marble plinth, stands the great Aberdeen granite sarcophagus, containing the body of Prince Albert. At each corner kneels the bronze figure of an angel, with clasped hands and outstretched wings, designed by Baron Marochetti, while on the lid of the tomb lies, at full length, the effigy of the Prince, sculptured in white marble, and representing him in the uniform of a Field Marshal, with the mantle of the Order of the Garter draped around. This fine work was the last ever executed by Marochetti. It was on December 17th, 1862, a year after Prince Albert's death, that the mausoleum was consecrated. On the following day the body was removed from St. George's Chapel, where for twelve months it had been resting; but it was not until 1868 that it was placed in the sarcophagus, which, half-filled all these years, has since been awaiting the present sorrowful eventuality. A vacant space on the lid, beside the effigy, also remains. No other tomb is placed in the mausoleum, the Duke of Albany and the Duke of Clarence and Avondale lying in the Albert Memorial Chapel in Windsor Castle. Here, on Saturday next, the remains of the Queen will be interred with that ceremony which befits a sovereign of our Empire.

SKYLINE.*

BY HASTWELL GRAYSON, B.A.

MANY many years ago Sir Walter Scott's poetic fancy led him to advise intending visitors to Melrose Abbey to "go visit it by the pale moonlight." There is a tradition that he did not practise what he preached, for on the only occasion when he went to "view fair Melrose aright" a passing cloud obscured the moon altogether. But however that may be the idea in the poet's mind seems to have been that in a strong light the abbey lost some of its charm. Stripped and ruined, roofless and ivy-clad, the architecture had perished and little remained except sentiment and a skyline. The buildings which we build to-day are not likely to have much sentimental value in our lifetime, but nearly all can have a skyline from the commencement. Scott is right—a skyline, like sentiment, has greatest power in a pale light. Defects arising from poor detail, meaningless features, and the poverty of materials, are gradually lost as the light fades, but the outline becomes more manifest. So true is this that Ruskin advises the young architect to try and conceive his buildings "as the dawn lights them and the dusk leaves them."

Except indirectly, the ordinary text-books hardly allude to the importance of skyline, and I cannot find that anyone has ever tried to analyse the why and the wherefore of an effective silhouette. I propose after tracing the influence of the earlier and greater styles of architecture in outline to venture on a few theories for which I cannot quote any authority.

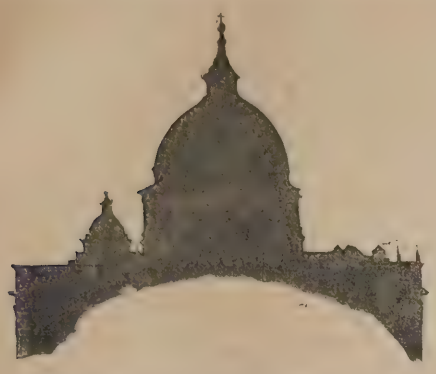
Mr. Ingress Bell has pointed out that the ancients for various reasons paid little attention to skyline. The earlier Egyptians were content with mass, and were satisfied if their buildings were impregnable to time. Later they devoted much thought to colour, while still chiefly relying on mass. The Greeks, perhaps consciously, kept their outlines exceedingly simple in order that nothing might detract from the sculpture and detail. The pediment was their sole concession to outline. The Romans went a stage further; they invented the circular plan, which soon led them to build domes. But they designed them to suit the interior without caring apparently how clumsy the exterior might appear. The first really conscious efforts to obtain good skyline are found in Constantinople, but whether this is the work of Romans or Turks I cannot say. The flèche appears to be part of Hadrian's design; yet, on the other hand, the minarets adjoining the church look like later additions. These additions give much finish to the composition, and the height of the minarets counteracts the heaviness of the domes and semi-domes. This combination was perfected by the Turks in Cairo, where the minarets were made part of the church itself, and not merely adjuncts.

The Christian architects of the Middle Ages worked on entirely original lines. They made a belfry (or rather a bell-tower) an integral portion of their design, secondly, they allowed the exigencies of their construction to become manifest against the sky, and thirdly, they provided their buildings with roofs that were distinct from the vaulting. Perhaps the most important point is the second one: to counteract the thrust of the vault they built pinnacles and parapets, which gradually became the dominant features in the outline. In the later days of Gothic art the roof was entirely lost to view and the skyline resolved itself into rows of small pinnacles, above which soared the spire, itself but a pinnacle, of a larger and more elaborate character.

The Renaissance brought another change. As Mr. Bell says, "the Cathedral of Florence and its unrivalled campanile are amongst the most lavishly ornate buildings in the world, but their enclosing lines are simple and severe. Only on the summit of the vast dome does the almost universal instinct assert itself in a delicately designed lanthorn as *finish*."

At this period architecture completely changed its character. Throughout the Middle Ages it had been the handmaid of religion; it now became the servant of the people. The labour, the genius and the energy which had been lavishedly devoted to the service of God, and to those who proudly claimed to be His earthly representatives, were diverted and made to minister to human wants and comforts. A new feature, infinitely more influencial than the pinnacle, became universal. How the ancients warmed themselves, or indeed whether they ever were warm in winter, is a mystery to-day. We know that they had vast kitchen fires, we also know that, except where smelting works existed, the forests supplied fuel enough for the wants of the people. From the sixteenth century the use of the flue gradually spread downwards from the king's palace until to-day almost every room that is built is signalled above the roof by chimney and pot. In the course of centuries the architectural genius of the world has practically conquered the difficulties of grouping flues and ornamenting the stack containing them. Future ages have but one task left—that the crowning one—the chimney-pot.

First let me deal with the old adage, "a spire for a plain and a tower for a hill." It is an excellent piece of advice, but, like the old copy-book maxims, it does not go far enough and leaves the half untold. I should like to expand it thus: All buildings—and especially churches, which are generally isolated—are affected by their environment, and a contrast with their natural (and in a less degree with their artificial) surroundings is most likely to prove successful. Let me cite two instances. Have you ever rowed across one of the English lakes and noticed the old cottages and farmhouses that here and there border the banks? They are very squat and square, have no bay windows, the roofs are covered with large stone slates laid to a flat pitch, there is very little light and shade about them; and yet they look very well. Again, have you ever walked down Princes Street, Edinburgh, and noticed the happy effect of the National Gallery with its long low flat roof? In each case the success is due to contrast. The fells that cluster round the lake and the little promontories and tiny bays that make the shore provide a feast of varied beauty in which the farmhouses, through no effort of their own, are included. If their builders had had a little more ambition they would have tried to compete with Nature, and failed. Ruskin, who as a young man loved to lay down the law with many superlatives and much alliteration, ventures to assert that "a single villa will often mar a whole landscape and dethrone a dynasty of hills." In the second example mentioned the long roof of the gallery helps to emphasise the rugged grandeur of the castle and, on the other side, the height and gracefulness of the Scott Monument.



A tower, because it has a simpler outline than a spire, shows to greater advantage where Nature is bolder. A spire looks best standing by itself in a plain high above the tree tops

GODSTOW OLD BRIDGE, OXFORD.

Emphasis at Intersection: Subordination of the Vertical.

* A paper read before the Manchester Society of Architects on December 13th, 1900, and before the Liverpool Architectural Society on December 17th, 1900.

ST. PETER'S, ROME, FROM THE VATICAN GARDENS.

and the roofs. As a general rule, the eye in a flat country is grateful for every kind of landmark, towers and spires, windmills and trees. In Liverpool we have an excellent example of how even a factory chimney can give a focus to an otherwise dull landscape. The north end of the town, as seen from the river, presents a monotonous line of warehouse roofs rising steadily one above the other as they recede from the river — so monotonous that the Vauxhall chimney is a most welcome relief.

The value of a contrast in skyline is very curious, because the exact opposite is the rule with materials. Nothing looks worse in a rocky country than red bricks (except red tiles), and half-timber work is generally fatal where trees are rare.

My second theory is almost a corollary of the first. It is this: Where two or three long lines meet, it is well to emphasise the point of intersection. By long lines of course I mean such as are seen in perspective: the lines may be caused by the ground, by the walls, or by the roof. This is the reason why a finial helps nearly all gables, whether they have bargeboards or copings, why a flèche sits so nicely at the intersection of several roofs, and why a turret in the corner of a quadrangle appears so snug and appropriate.

But nowadays in ordinary practice we depend for our skyline almost entirely on chimneys. Partly because the use of cut and moulded brickwork has become so general, and partly because clients are now most outspoken about downdraughts, chimney stacks have of late years been growing in height. For efficiency and for economy they are best when built on the ridge; not on the eaves. For these reasons alone they would naturally appear to greater advantage. Chimneys rising direct from the eaves, unless attached by a gusset roof to the main roof, look unnaturally thin and weak, especially if "supported" by an iron tie. The effect is much improved if on plan they project considerably. A good building can be spoilt in many ways by its chimneys. They can be too numerous, which suggests bad planning; they can clash with other features and make the outline confused; they can be too high, which makes them look extravagant and the rest of the building too small; and—perhaps this is the worst of all—they can be made too small, a fault which leads to those fearful objects known in the trade as patent cowls.

I have a few illustrations of most of these points. The Gothic mansion at Narrow Water exemplifies the reverse of my theory: there are no long lines in the view, therefore the architect worked on the principle that "many a mickle makes a muckle," and emphasised the intersection of all his lines; and to make matters worse he has made a special feature of every single flue. The result is a perfect jungle of pinnacles and turrets, chimneys and finials—an awful waste of money and an architectural failure.

The exact opposite is seen in the sketch of the Nunnery at Salford Priors. There is such an absence of chimneys as to give the house the appearance of being uninhabited. Perhaps the nuns have no fires; in any case, they must find their home rather chilly, as it is built on the principle "of Hardwick Hall, more glass than wall."

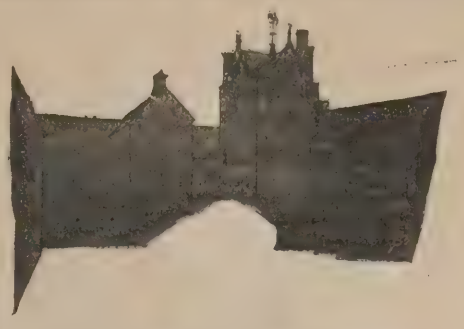
An almost perfect skyline, to my mind, is that of Fytton Manor House. If it has a fault it is that the main roofs do not mitre on the same level. The charm of the contour appears to arise from the happy distribution of the parts and not from the parts themselves. Each one leads upward and onward to the next. Even the conservatory seems to fit against the gable and help the length of the façade.

The cottage at the Godstow old bridge follows somewhat similar lines. A chimney marks each end of the ridge; on one side it is built in and almost hidden by a low gable, while on the side shown in the photograph the chimney boldly projects, and is buttressed by a hipped lean-to roof. The whole makes a very complete and satisfactory outline, which gains very greatly by being duplicated by reflection in the river. That is a point which should be borne in mind by anyone designing a building which will adjoin a sheltered piece of water.

A further instance of a chimney successfully completing a ridge is seen at the Hall at Balliol. The flues from the men's rooms adjoining are incorporated into the end wall of the hall, and serve to emphasise the point where the roof meets the coping—a point which would have appeared characterless without them, for no finial could have finished a gable of that size. The bareness of the other end is masked by a gable over the high table bay flanked by the chimneys from the kitchens.

The sense of bareness which Balliol avoids is very noticeable in the Rathhaus at Molsheim. The apex stones and finials on the gables are lost in the vast expanse of roof. The coping also is far too thin, the result being that this great roof, which from its very size should have been commanding, becomes featureless and disappointing.

My third point is the value of a complimentary feature. This is perhaps most noticeable in Classic work. Think of the great dome of St. Paul's and the two western towers: how much they help one another and assist us to estimate the size of the dome. The source of the harmony lies in their resemblance. We call one dome and the other tower; but they both have a domical outline and are unmistakably parts of the same building even when supervening roofs hide any connection between them. Without these western towers the cathedral would have sunk to the level of several well-known buildings, where the dome is everything and the church only the support.



A large round tower gains very much if a turret clings to its side. The French, especially about the year 1500, made a frequent use of this form. If a tower was unsuited to a turret, they always built a second tower near, as at Amboise and Azay-le-Rideau. In the Inglinger Thor Stendal we have another treatment. Here the circular tower does not sit very comfortably on the square base, but it would have been infinitely more out of place without the angle turrets.

Another example of a complimentary feature of a rather different kind can be seen in houses of the F plan—the plan in which a small gable with a slight projection is placed in the middle of the façade and a larger and deeper gable near the end. In an open site the F plan is much more likely to give a good outline than the E, of which the architects of Elizabeth's time were so fond. Yachting men may perhaps agree with me that a yawl looks more dainty and complete and even larger than a boat of the same size which has only one mast.

My last theory is that the vertical portion of an outline should be kept as subordinate as possible. Vertical features are, of course, necessary, often constructional, but if possible they should not be prominent on the skyline.

FYTTON MANOR HOUSE, ST. GERMANS, NORFOLK.

COMBE SYDENHAN MANOR, SOMERSET.

Nature provides us with an example in the stem of the larch tree, Scotch fir, and many others, but she generally contrives to batter the lowest portion and to conceal the upper. I have already pointed out how the conservatory at the Nunnery and the lean-to at the Godstow cottage complete the picture and provide a gradual finish at the base, which is almost as important as a definite feature at the apex. The base to Cæsar's Tower at Warwick Castle is almost double the size of the vertical portion. Mr. H. W. Brewer, in those wonderful architectural compositions which he has been publishing for the last thirty years, gives many instances of excellent skylines, but they are all of the upward and onward type: vertical features he has in plenty, but not against the horizon. Mont St. Michel, that grand personification of the Church Militant, has hosts of towers and buttresses which rise sheer up to giddy heights, but with the exception of a small portion of the piers against the great Hall of the Knights, the sublime outline is not the result of high walling. The effect of too much vertical outline can be seen in the Palazzo Vechio at Florence, a building whose tower fits on the main block like the shaft on to the handle of a T-square.

This is as far as my theories carry me. To recapitulate:—In order to obtain a good skyline, it is well to have a marked contrast with the natural and artificial surroundings; to

THE NUNNERY, SALFORD PRIORS.

emphasise the intersection of two or more long lines; to provide a compliment to any strongly-marked feature; and to take care to keep the vertical portion of the outline as subordinate as possible to the inclined.

I endeavoured to satisfy myself that a dormer should have a sharper pitch than the main roof on which it rests, but after some consideration I came to the conclusion that it depends on how much of the main roof is visible. The larger the roof the steeper the better. The dormers may follow the same slope or they may not; in either case they can fit very snugly, provided they are not too long. A very steep dormer which hides too much of the main roof is like a man with a big nose and a receding forehead. It seems to show an unnatural proportion, curious perhaps, but *not* intellectual. We often see dormers of too large dimensions or too near adjoining dormers. That is another instance of failure in proportion. The castle at Hameln has four very large and elaborate dormers which can just find room to balance on the eaves without elbowing each other off. The main roof is quite lost, with the result that the skyline becomes as crowded with large features as that of Narrow Water is with the chimneys and pinnacles.

I remember hearing a story that a pupil once asked Mr. Norman Shaw what pitch he should make a dormer. Mr. Shaw sketched the dormer in freehand. The pupil measured it and finding that the angle was 51 deg. delighted Mr. Shaw

RATHHAUS, MOLSHEIM.

by telling him that it was exactly the same as the Pyramids. The angle of the Pyramids is generally considered to be the acme of perfection—for a pyramid; but it was a mere coincidence that Mr. Norman Shaw's dormer should have the same angle.

One of the blessings for which we have to thank the Gothic revivalists is the reintroduction of the gable. The eighteenth century was all for cornice and coping and a featureless skyline. Pediment is all very well when seen in full elevation, but as to suit that point of view the pitch needs to be very low, the effect is lost in acute perspective. So enamoured however were our great-grandfathers with this flatness that it is very doubtful whether there exists a gable that is more than sixty and less than a hundred years old. So many English towns were rebuilt during the age of the hip and coping that I hardly know an English street of gables, although before Queen Anne lived and died the continuous row was invariably the rule. We have a good many in Chester, but not a street *full* of gables. The streets in some old German towns show what we have lost. No form of roof can give such an endless play of light and shade, such variety of outline, and yet preserve the identity of every building. The market place at Munster contains a large sprinkling of sixteenth and seventeenth century gables. In our English streets we are now getting a few gables, but chiefly where expense is *not* the first consideration. The excellence of large Welsh slates as a covering for roofs of 30 deg. tends to maintain to-day the fashions of eighty years ago. On the other hand, in the thousands of little villas—single and semi-detached—which, like mushrooms, spring up in the suburbs, gables, hosts of little gables, can be seen, but hardly ever a large one. A large gable requires to be carefully designed; the small ones only can follow the stock pattern.

I find that Mr. Statham, in his book on modern architecture, comes to the exact opposite conclusion with regard to a street full of gables. He declares that our modern examples are only designed by architects who make a fetish of their skyline; he warns us that there is a risk in the long gutters between adjoining buildings, and adds that the attics under longitudinal ridges are much more uncomfortable than those under cross gables. He ends by recommending flat roofs on town buildings and obtaining a skyline by building some blocks higher than others. A skyline composed of square lumps can look extremely well. I do not think that anyone would deny that who has sailed up New York harbour and seen from three miles or so—not less—the grouping of the sky-scrapers; but to see a row of square lumps every time you look along the street is quite another matter, and surely it is just as difficult to construct a flat roof as a gutter, and the flat roof is more costly, at any rate in the City of Liverpool, where the Health Committee have decided that such a roof is an outside wall within the meaning of the Act, and must therefore be constructed of brick, stone, or other incombustible material.

The superstition that uniformity is the perfection of architecture still lingers to spoil many a skyline. The fallacy is manifest. A building can only appear uniform from one particular point of view; if that point is the only one, or if the great majority of people can be induced to view it from there, then uniformity becomes ideal. Vanbrugh carried the principle to its logical conclusion in the great carriage-drives which lead up to his country houses. Some of our public buildings, and many abroad, have a large place in front and converging streets beyond it. Under such conditions uniformity can be seen to proper advantage. But on a site with a greater width than the open space in front, or on one approached sideways or diagonally by a principal thoroughfare, uniformity often leads to disaster. One half of the building blocks the view of the other half, the balance of parts is lost or distorted, and features become prominent (such as the roof behind the pediment) to which little or no attention has been given. If more thought were given to large buildings they could be designed to look their best from the points from which they are most often seen. The tower at the Brussels Law Courts, although by itself most majestic and monumental, appears foreshortened and narrow from the square opposite the main entrance, and cannot be properly seen from any point within a mile. It looks its best from the rising ground two or three miles beyond the lower tower. Considering these circumstances we may fairly ask, Was the tower worth the great cost?

Let me close with a sentence from Mr. Ingress Bell: "In a building the skyline is the most important line, for the relief of solid against solid cannot be so sharply defined as the relief of solid against vacancy, and the play of light and shade, which we can give to our façades, is as nothing to the contrast of their dark margins with the clear air above."

NARROW-WATER HOUSE, NEAR NEWRY. "Fuss."

R. I. B. A.

PRIZE DRAWINGS, 1901.

THE annual exhibition of the students' work in the competitions of the Royal Institute of British Architects, which closed on Saturday last, afforded evidence of much industry, and some matter for reflection. There has not been such a large muster of the forces architectural for a considerable time.

The popular subject this year without question has been the Tite Certificate and £30 for travel in Italy, a moderate ambition established to specially foster the study of Italian architecture. It is a matter for regret that the object of the prize is in a large number of instances entirely ignored by the competitors and weird and strange wanderings of fancy are exhibited. The subject of the study was "An Entrance Gateway to a Public Park." This tempting project elicited twenty-six more or less commendable efforts. The prize, as already announced in our columns, has been awarded to the design under the motto "Corona" (W. Fairbairn), whose conception fulfils the object of the founder. The drawings are in pencil, feelingly executed and delicately tinted in lampblack: they are carried out in the Corinthian order. In general character the design is somewhat commonplace, being of the triumphal-arch form, and it would be entirely orthodox were it not for the somewhat incongruous introduction of Jacobean elements into the sculpture; but the whole set out is most commendable. Ten guineas is awarded to the clever and original design "St. George" (Ralph Knott); a double colonnade flanks the entrance, an advantage not possessed by the prize design, which in this respect looks somewhat thin. This is a common error into which nearly all the competitors have fallen. The design is somewhat worried by the over-verticality of the massive iron grille which entirely fills up the intervening spaces between the columns. The equestrian figures are rather dwarfed, and the perspective would be improved by the elimination of a questionable sky effect. The drawings are rigourously executed, and there is evidence of power in the representation of the sculpture and decoration, though the former suffers considerably from violence of form. Honourable mention is accorded to "Marble Arch" (W. A. Mellon), the most ambitious of the three designs selected, and perhaps of any hung; but the design is full with a big idea of scale which is an important element absent from a large number of those exhibited. The attic of the building, however, is very crude and

unfinished. The whole is carefully worked out, although the draughtsmanship leaves much to be desired.

"Le Nord" misses the idea in the exuberance of free treatment of nondescript. "Civis" is a simple Classic design with a rather elongated treatment of arcade having segmental heads. "Pencil" is certainly among the most interesting sets of spirited drawings, and an excellent sketch is included; it exhibits knowledge of what the author is doing. "Fiori" has good points, but it is a fine conception sadly marred by the view, which does no justice to the design. "Fiori" should know and can do better with such a design!

"Alfio" exhibits a good perspective, but "Boadicea" is rather stage-struck. "Nep," "Spes" and "Rus in Urbe" have all worked hard. The last-named has a great monumental frieze which needs more plain surface. The design under the device "Lion" is one of the best in the room: it exhibits good, clear, ink line-work and is of pleasing and dignified architectural character. The author has certainly scored by recessing his colonnade, which would have a fine effect; it is utilised in a practical manner as a pathway. The perspective does the design scant justice, and is blotted with vagaries, wormy skies and unhealthy trees, which neither inspire admiration nor advance the author's reputation; but it makes one wonder at the preference of uncanny and questionable impressions for simple nature.

Twenty-two competitors entered for the Soane Medallion and £100. A worthy subject was set for this important studentship—a design for a "Club House in a Large City." A similar subject was set in 1882 It failed then, although an award was made. It has failed still further in 1901, no award being made, though an honorarium of thirty guineas is granted each to "Ars" (M. J. Dawson), "Hiawatha" (H. Munro Cautley), and "Ionic" (J. B. Fulton). "Ars" is noticeable for a softly-tinted perspective and fairly good plan. "Hiawatha" submits a generally careful set of drawings, and the same may be said of "Ionic," in which Mr. Fulton has moderated his imagination and mannerisms in an excellent, if somewhat overwrought, set of designs.

The reason of the competitors' failure is not far to seek, and the Royal Institute has done wisely to mark its displeasure at the weak spot, which, as in 1882, is the plan. No one seems to have enquired what would be the requirements of working a club of even modest dimensions. Criticism would therefore entail an exposition of the planning of a club. "Ultimus" shows good work; "Thistle" a free perspective; while "Thor" is an echo of 1882 in the line of the perspective. "Q. E. F." has a softly-tinted perspective, which is not improved by the curved bay windows. A number of the designs ought not to have been submitted; they take up valuable space, which the crowded gallery can ill afford.

In the domain of construction the Grissell medal and £10 10s. goes to "Pons Asinorum" (Edwin Forbes) for an excellent design, the only comment being that it would look almost as well in stone; we think that it should be unmistakably wood; this can certainly be said for the pleasing and simple lines adopted by both the authors of the designs marked respectively "Shingle" and "Forward." Fifteen other competitors of varying merit responded.

The competition for the Pugin Travelling Studentship is not so keen this year, the conspicuous feature being the absence of distinctive measured work and what might be termed practical studies. H. W. Cotman justifies his position as Student by his large collection of somewhat small studies drawn with considerable power and feeling, the character of which savours somewhat of the Architects' Note-Book; the sketches have certainly been made with the object of study and investigation. Mr. Cotman submits some measured work from Norwich cloisters. A. J. Pitcher and J. Forbes-Smith are honourably mentioned. The former has interesting measured work from Tewkesbury Abbey and Malvern Priory and the latter a full and conservative display with much careful and painstaking work. The most distinctive and interesting feature of the competition, and perhaps of the whole exhibition, are the vigorous and powerful pencil sketches of Shirley Harrison, and they deserve longer notice than it is possible to give here. It is a pleasure to see such strong artistic individuality linked to architectural study. Mr. Harrison's exhibit is most attractive. Frederick Horth has a large and varied display, including some good colour-work from Antwerp. J. C. Cook shows a sketch of Westminster cloisters "virtually untouched," but why proclaim in blacklead this virtue, and why ever retouch a sketch? Mr. Cook, however, shows good powers of work. Heaton Comyn, C. B. Pearson and Harry Phibbs make up the number of competitors in this interesting struggle.

The Owen Jones Studentship requires a notice to itself. Six competitors entered and as anyone of them would have made an excellent Student the selection must have been somewhat difficult. Hervey Rutherford, who is the prizeman, has an excellent collection, beautifully drawn. Ramsay Traquair runs him very close and is awarded a medal, while E. Bennett has honourable mention; the latter is not so strong in the examples of old work he submits, but his original designs of colour work, especially of the yacht, have called forth much enthusiastic comment.

The measured drawings are interesting but have not this year risen to the high level of some former years. The silver medal and £10 10s. goes to "Stafford Knot" (Lawrence Bright) for an admirable delineation of Kirby Hall; £5 5s. to A. Wyatt Papworth for that strange building, St. John's, Westminster; and a similar award to H. F. Traylen for drawings of Burghley House, which seem to lack a really good plan. "Semper Fidelis" has an excellent set of that most interesting building, the Guildhall at Exeter.

At St. Matthias's Church, Earl's Court, S.W., a memorial to the late Rev. J. P. F. Davidson, vicar of St. Matthias, is to be erected, in the form of a lofty screen on the present low wall crested with metal work which separates the chancel from the nave. A great many of the subscribers were in favour of a rood screen, but in the present uncertainty of the law on such matters, chancellors in different dioceses taking opposite views and deciding according to their personal predilections, it was considered useless to apply for a faculty for a rood. The memorial screen is to be of oak, light and open, so as not to interfere with the view of the altar and stained east window, and designs are in course of preparation. The memory of Mr. Davidson will also be perpetuated in the church by new choir stalls and the adornment of the pulpit with carved work.

GLASGOW ROYAL INFIRMARY COMPETITION.

Action by the Glasgow Institute of Architects.

WE have received from the Secretary of the Glasgow Institute of Architects the following copy of a letter addressed by the Institute to the Chairman and Managers of the Glasgow Royal Infirmary:—

Recognising it to be your earnest desire that the Infirmary, when reconstructed, should conform to the most modern standards of design in this class of building, and that the subscribers and the general public have a right to expect this, we, the Glasgow Institute of Architects, as a body of technical experts in such matters, feel it to be our duty to state that, in our opinion, this result will not be achieved if the reconstruction is proceeded with according to the plans selected by your sub-committee in the recent competition. We attribute this failure not to any lack of zeal on the part of your committee, or of ability on the part of the competing architects, but mainly to the manner in which the competition was initiated and carried through, and that in the following respects among others:—

(1) That along with the printed conditions provided for the competition there were issued two sets of sketch plans as indicative of alternative arrangements which the sub-committee recommended, and which were stated in the accompanying report to be drawn by or under the direction of two members of the sub-committee respectively. (2) That a Jubilee block to be situated on a particular part of the site was insisted upon as an integral part of the scheme.

OF BALLIOL COLLEGE, OXFORD.

The results of these elements in the conditions were:—

(*a*) That the competitors and the assessor were hampered in the exercise of their individual judgment as to the main points of importance in such a building, namely, the distribution of the various buildings with respect to each other for convenience of working and of all for the freest access of sun and air.

(*b*) That the competitors were placed in the invidious position that, in the event of the schemes recommended by the committee not proving themselves to be in accord with their judgment and experience, they were bound, in departing from them, to meet with disfavour from those influential members of the committee who would enter upon the examination of all the plans with minds necessarily biassed in favour of those which they themselves had put forward, while reserving their position as judges.

(*c*) That as the result, the proposal that plan E be accepted, which became the finding

of the meeting, was moved by the gentleman who was actually the author of the scheme which was adopted and worked out in detail by this competitor.

(3) That neither of the sketch plans issued are in accord with the present-day principles of hospital design, as might indeed be expected, seeing that their authors have not enjoyed the training which would qualify them as surgical, medical, or architectural experts; that, in fact, the plans are in many vital particulars inadequate and out of date, and that these faults are naturally displayed equally in the selected design, which is but an elaboration of one of them. A corroboration of this assertion with regard to the radical faultiness of the plans in question is furnished by the fact that six out of the ten competing architects found it necessary, in spite of risk of possible consequences already alluded to, to entirely throw over the schemes furnished to them, and that among this number are found all the four architects from outside of Glasgow (two from London and two from Edinburgh) who were presumably invited specially on account of their knowledge of hospital design.

Such being the opinion of the Institute after a very mature and careful consideration of the whole subject, we would most earnestly urge the managers, before committing themselves and the public to the erection of any portion of the building, as designed, to have the plans submitted to one or more independent hospital authorities of recognised and outstanding position for consideration and report.

Apart from the all-important question of the erection with the public funds of an entirely adequate and modern hospital, we, the Institute of Architects, feel it necessary to lodge a protest against the setting-aside by the sub-committee, without any reason given, of the award of the professional assessor, Dr. Rowand Anderson—the more so that a simple majority of one was considered sufficient to overturn his judgment—as liable to prejudice the success, alike for promoters and architects, of future competitions in Glasgow. And we have further to state that the erection of a Jubilee block, such as is proposed, seven storeys high, and in the position selected, will, if proceeded with, dwarf and irretrievably injure for all time the external appearance of the cathedral. The foregoing statements represent the unanimous finding of the Glasgow Institute of Architects at a meeting specially called to consider a Report of the Council on the question, and as the matter is not only one of the greatest public importance but of extreme urgency, owing to the proposal of your sub-committee to proceed at once with the erection of the northern block, it has been communicated to the public press at the same time as it is submitted, with our earnest prayer for its consideration, to yourselves.

THE KAJEN, HAMBURG.

Correspondence.

Lightning Conductors.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, E.C.

SIR,—While agreeing with the writer of the article on this subject in your issue for January 2nd that cases of damage by lightning to buildings supposed to have been protected by conductors are far more numerous than they should be, I consider that the remedy he appears to advocate, far from preventing such occurrences, would tend to make them more frequent. Unfortunately the subject of protection against lightning is often supposed to be a very simple matter, whereas it is a most complicated subject. Some of the misconceptions which I consider are largely responsible for the errors in practice are indicated in the article in question and foster the ideas (1) that lightning is a "fluid" stored up in a thundercloud; (2) that the only problem is to carry this "fluid" away without obstruction; and (3) that lightning conductors attract lightning. Other remarks to which I must take exception are that the practice of using copper chains for conductors has more or less survived; that a drain can be used to obtain satisfactory "earth"; and that coke is used for the purpose of retaining moisture. I must also object to lightning being termed erratic, if by this it is intended to imply that it follows no laws. These little misconceptions which, unfortunately, are not confined to architects, are responsible for many of the cases of misapplied and faulty conductors, and the consequent failure of so-called systems of protection. It would be as well if architects and others responsible for buildings thoroughly understood the action of lightning and the means necessary to ensure freedom from damage, but no one could expect to master the subject without devoting many years of study to it, and there are already so many subjects of importance which it is absolutely necessary for architects to know that I think very few would be able to spare the time for what is, in my opinion, the most difficult subject connected with architecture. I have seen specifications by architects which have left nothing to be desired; but, on the other hand, I have seen many in which (apparently as a result of some study) extraordinary pains have been taken, and extra expense incurred, to make the conductors almost useless. This question is one more than any other for experts, and why, therefore, should an architect take trouble and responsibility when by leaving the matter entirely in the hands of a specialist in whom he has confidence he can avoid blame in the event of a damage which may have very serious consequences. One fact is certain—any structure can be rendered absolutely proof against damage by lightning by the application of a proper system of defence, but safety cannot be gained without a thorough knowledge of the subject.—Yours truly,

ALFRED HANDS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I am much obliged to Mr. Hands for his criticism of my article and have carefully read his letter with a view to ascertain what precautions he advocates against possible accidents; but unfortunately the result is negative. Mr. Hands pithily remarks: "One fact is certain—any structure can be rendered absolutely proof against damage by lightning by the application of a proper system of defence, but safety cannot be gained without a thorough knowledge of the subject." Thus he ends his letter, just as I was hoping to glean what was this "proper system of defence." Is knowledge in this important matter like a patent medicine, in the hands of a few and only to be obtained by going to a particular place for it and then accepting in faith whatever is given us? There are other points in Mr. Hands' letter I cannot profess to understand, nor can I find that I said anything in my article about lightning being a fluid "stored up in a thundercloud." Every schoolboy knows the primary cause of thunderstorms. As to Mr. Hands' remarks that "lightning conductors attract lightning," what are they for if they do not attract the electricity in their immediate neighbourhood when it gets into dangerous proximity with the building the conductors are intended to protect? Mr. Hands has indeed finished his letter too soon. No doubt he can give the conclusion at another time.—Yours truly,

CHARLES E. SAVERY.

Quarry Notes.

Effect of the Sun on a Monument.—At Indianapolis, U.S.A., is a soldiers' monument which is the chief pride of that city. The huge mass of stone sways from side to side as the rays of the sun strike it. In the forenoon, when the sun is shining on it, the monument bends to the west, because the stone composing the east walls are expanded by the heat and tend to throw the structure toward the west. At noon it leans toward the north. In the afternoon it leans toward the east. The variation is slight, but it exists. On very hot days the bending is more pronounced than on cooler days.

Emery, one of the hardest substances known, comes from the island of Naxos, in the eastern Mediterranean, whence it has been exported for the last two centuries or more. The beds are in the north-east of the island. There are about 300 men engaged in the trade, all of whom have to be married. The material is much too hard to be dug out or even blasted. Great fires are lighted around the blocks till the natural cracks expand with the heat, and levers are then inserted to prize them apart. This system is continued until the blocks are reduced in size to masses of a cubic foot or less, and they are then shipped as if they were coal. There are said to be 20,000,000 tons yet available at Naxos, and the last reported year's export was 3,950 tons.

POSITION OF ARCHITECTURE IN AMERICA.*

THE past year has been one of prosperity for the American Institute of Architects. Our debts are paid and we have a balance on hand in our treasury. We have a journal of our own to represent us before the world, and we have a dignified home, in which we all take the greatest pride, where our growing possessions are handsomely housed and which we hope may for a long time to come serve as a centre of national usefulness and influence.

I now desire to draw your attention to four general subjects. I wish briefly to review the relations of our National Government towards the art of architecture, our attitude towards the youth of our profession, the condition of our professional intercourse with one another, and our position in regard to the art to which we have devoted our life-work.

Relations between Architecture and the National Government.

As a national institution, our first duty is to our country. We all wish to help to our utmost those in authority in their endeavours to make our Government architecture more worthy of the greatness and intelligence of the Republic. In the City of Washington the whole country has an admirable object-lesson. No city is more full of architectural warnings. None better exemplifies in its buildings what is and what is not architecture. One does not need a professional education to feel mortified at the sight of certain buildings that have been thrust upon these beautiful highways in comparatively recent times, though what architecture is and of what it is capable is thrown in the face of the most stolid citizen whenever his eye is turned beyond the crowded avenue to the green park and the long lines of the marble Capitol, and to the great white dome rising grand and noble above them into the morning mists.

As we feel all this very deeply we have reckoned it a great privilege that the National Government has, of late years, consulted with our officers and members regarding work in charge of the Treasury and several other Departments. On these occasions, and at all other times, we have advocated in an unselfish manner all measures that might lead to added dignity in our permanent Government buildings and greater stateliness throughout our National Capital. If great Government buildings are to be scattered about the country, if a boulevard is to traverse the National Capital, if the future buildings for the Government are to be effectively placed in this beautiful city, if the White House, in which we all take such pleasure and pride, needs to be increased in size, we want each and all of these works carried out by the best artistic skill that the country can produce and by nothing less efficient. Nor are we alone in this wish. So far as I have observed, the public aspires to even better things than our best talent produces. They want the very best. Now that architecture is a matter of active interest to great numbers of people in all parts of the country, it ought to be possible to bring to life again the admirable artistic spirit which one hundred years ago planned the City of Washington, and built its earlier and best monuments.

The Institute anxiously desires thus to promote the improvement of architecture controlled by the National Government, and we have an opportunity to see what has been accomplished by the Government, under its new system, in the exhibition that is arranged for this meeting of the drawings for those Government buildings that are in charge of private architects.

Concerning the Supervising Architect's Report.

The current newspapers state that the Supervising Architect of the Treasury has advised in his report that the supervision of Government work designed by private architects be in charge of the Government office. I hope our good comrade will find some other remedy for whatever difficulties there are in applying private practice to public work. An architect's business is to build buildings, not to sell drawings. The designer's supervision, at least of artistic details, is most essential to success, and it is certainly common opinion that all over this country the constructive portions of great buildings are superintended for private corporations by their architects in more energetic and economical ways than those that the Government has usually been able to adopt. It seems to me, therefore, that if the Supervising Architect has had some unfortunate experience, or if the Government demands more exactness and routine than private clients, the employment of a really efficient clerk of works on every building, paid for by the Government and under the control of the architect, in addition to his supervision, would probably afford a full cure for such trouble as may exist.

We never discuss the question of Government architecture without recognising the attitude held from beginning to end by the present Secretary of the Treasury. We have formally thanked him before now, but we cannot forget the broad and liberal views he has always held towards our art. We cannot forget his great and patient consideration of those members of the profession who have dealt with him on these subjects, and the singleness of purpose with which, in spite of discouraging rebuffs, he has held firmly to a large-minded and intelligent course. By his loyal deference to high professional standards, he has set architects an example of how they themselves should regard their own professional dignity. If the present method of conducting the architectural work of the Government produces, as we hope it will, a great result, it will be due in the first instance to Secretary Gage.

Architects' Assistants.

No subject can be of more serious interest to the Institute than its relations with the youth of our profession. One of our committees has considered for us, and will report to us upon our relations with the architectural schools and the junior societies. Many of our Chapters have taken steps towards unity of effort between the young and the old. To make progress in membership from the junior societies to the Chapters easy and natural and desirable should be our first endeavour. Indeed in this country such a task ought to be easy. One of the greatest charms of our profession is the joyous atmosphere of youth and buoyancy and hope in which we work. The art itself is young with us. It is only within a few years that architecture has become the life-work of thousands in our country, and if, in establishing the profession, we have made many halting steps as artists, and if, in the swift turn of the wheel of progress, a man only too quickly comes to regret his early productions, yet we are all conscious of constant advance and full of faith for the future. We are all looking forward and not back. The assistants who form our office families, and in co-operation with whom our work is produced, are young. They are ambitious youths, who, at home and abroad, have had every advantage of education in art and engineering. They and we work together in the full belief, that, even if the future of architecture does not lie with us yet, at least it is to have a great future here. Everywhere the pace set is that of youth, and the rapidity of our building operations makes our work so arduous and full of strain that the strong and vigorous only survive. There are no old architects among us. If an architect last at all he lasts young.

The young may nerve themselves to exertion by the thought that Raphael's career, with its abundant production, was over at thirty-seven. It is left to those of us who are older to remember that, though Bramante is said not to have seen Rome and the Pantheon until he was fifty-five years old, yet he was still young enough to form, after that age, his monumental style, and to evolve the work that has made him one of the great leaders of our craft. Recalling this, we, too, feel young, and take new hope and courage. We can scarcely prize too highly this happy, joyous, progressive, youthful spirit. As we thus keep young and hopeful, it should be easy for us, and, indeed, we should be eager to increase, in all practical ways, the cordiality of our relations with those who are our juniors in the profession, and who, we hope, are to be our successors in the Institute.

Some Charges.

When we consider our professional relations towards each other we open up a large field for discussion, for our efforts to promote the efficiency of the profession have been sharply criticised. One hesitates to discuss the question lest it obtain more importance than it deserves, but, as it is a live subject, it is well to see how far the criticism is merited.

It is charged that we are slack in administering discipline to those that play the game unfairly. That we "countenance men of eminence, who are not men of principle," and that our "present members are too weak to point the finger of scorn at the culprits in their midst." We are told that unless we enforce a standard of honourable practice more strictly we shall fall in public esteem, and the action taken by the Judiciary and Executive Committees this year in certain cases has seemed to some people inadequate. It is not for me to say whether this opinion is just, though one would suppose that our critics did not hold it to be a grave matter to be compelled to defend one's honour before our Judiciary Committee. One would think that censure by the American Institute of Architects was a light and unimportant thing, leaving no scar or no regret. Is it true that any of us think this? If we were the defendants, would the technical degree of criticism on our professional conduct matter much, compared with the misery of the thought that our comrades had criticised us and proved their right to do so? You may be sure that other men are made much as we are.

Although few of us would be in the Institute if discipline were its only object, still it is very desirable that we should claim a high standard of conduct, and even of etiquette, from our fellow members. It is one of the objects of our association. We may consider that we are agreed upon this. We all feel this so strongly that, when professional opinion attributes improper conduct and when adequate discipline does not follow, there is a widespread outcry that your directors and Judiciary Committee are weak-kneed. This course of reasoning is not just.

The subject of discipline involves really the larger question of professional ethics, and this is an opportune moment to discuss whether our standard is advancing, and whether our conduct towards one another is improving, and what we can do to further desirable improvement. This matter has difficulties of its own, for opinions may differ, fairly, at least, in regard to such details of professional conduct as are conventional and usual, rather than moral. Some of the opinions held of such matters are unsupported by legal right or by general business morality. In fact, they all are governed ultimately by public opinion, and the important thing is to have that in a healthy state.

Our controversies centre mainly around competitions, but no one can deny that even in this nerve-destroying and objectionable side of an architect's work public sentiment is far more healthy than it was. Probably we cannot do away with competitions, but the public in a short time always accepts what the self-respect of the profession courageously demands. To-day there are far more competitions that are limited and paid than formerly, and to the great benefit of employer and employed. To-day far more architects insist on these restrictions, and in the long run they gain by it. Public opinion has governed very strictly far more hateful things even than competitions—for instance, the practice of duelling; and it can be trained, and I believe it is being trained, to ameliorate competitions.

A Code of Professional Ethics.

As one instrument towards obtaining a healthy public opinion, the "American Architect" prints weekly the code of ethics that is recommended by the Boston Society of Architects. It is as follows:—

SECTION 1.—No member should enter into partnership, in any form or degree, with any builder, contractor, or manufacturer.

SECTION 2.—A member having any ownership in any

* Summary of the President's address at the annual convention of the American Institute of Architects held in December last.

building material, device or invention, proposed to be used on work for which he is architect, should inform his employer of the fact of such ownership.

SECTION 3.—No member should be a party to a building contract except as "owner."

SECTION 4.—No member should guarantee an estimate or contract by personal bond.

SECTION 5.—It is unprofessional to offer drawings or other services "on approval" and without adequate pecuniary compensation.

SECTION 6.—It is unprofessional to advertise in any other way than by a notice giving name, address, profession and office hours, and special branch (if such) of practice.

SECTION 7.—It is unprofessional to make alterations of a building designed by another architect, within ten years of its completion, without ascertaining that the owner refuses to employ the original designer, or, in the event of the property having changed hands, without due notice to the said designer.

SECTION 8.—It is unprofessional to attempt to supplant an architect after definite steps have been taken toward his employment.

SECTION 9.—It is unprofessional for a member to criticise in the public prints the professional conduct or work of another architect except over his own name or under the authority of a professional journal.

SECTION 10.—It is unprofessional to furnish designs in competition for private work or for public work, unless for proper compensation, and unless a competent professional adviser is employed to draw up the "conditions" and assist in the award.

SECTION 11.—No member should submit drawings except as an original contributor in any duly instituted competition, or attempt to secure any work for which such a competition remains undecided.

SECTION 12.—The American Institute of Architects' "schedule of charges" represents minimum rates for full, faithful and competent service. It is the duty of every architect to charge higher rates whenever the demand for his services will justify the increase, rather than to accept work to which he cannot give proper personal attention.

SECTION 13.—No member shall compete in amount of commission, or offer to work for less than another, in order to secure the work.

SECTION 14.—It is unprofessional to enter into competition with or to consult with an architect who has been dishonourably expelled from the "Institute" or "Society."

SECTION 15.—The assumption of the title of "Architect" should be held to mean that the bearer has the professional knowledge and natural ability needed for the proper invention, illustration and supervision of all building operations which he may undertake.

SECTION 16.—A member should so conduct his practice as to forward the cause of professional education and render all possible help to juniors, draughtsmen and students.

We thus become familiar with what we agree to in unprejudiced moments. It is a still better thing for us to discuss these matters in a friendly way at these meetings. The more we meet and talk with each other the more opinions crystallize, the better we know each other the less likely we are to yield to that hustling and crowding spirit that is at the root of any troubles that reach our Judiciary Committee, and it is one of the chief advantages of our Institute that it leads to that acquaintance and association of architects from all parts of the country which best subdues the mean or selfish hustler. Indeed, the older of those among us must all recognise that the term "unprofessional conduct" is now applied by general consent to practices which not long since were of not unusual occurrence, and that a distinct advance in this direction has accompanied the increase in numbers and power of the Institute.

But to demand a definite written code of ethics is to ask for something difficult of attainment. They have never been simple to frame and their enforcement has brought many a church and association to grief. In our case it would be difficult to state precisely what code should be enforced, even if it were agreed that any should be enforced. Happily, though we may feel helpless to form a code that we all agree upon, yet all these codes were, in fact, summed up once in a very few sentences that well might be printed in those journals which now print our less widely accepted codes. These sentences inevitably form the basis of all our discipline. Differ as we may in small details, we all know that upright, professional conduct means nothing but being a gentleman; and we are sure that all codes of professional ethics finally reduce to the Golden Rule. A healthier subject for our attention, and one that interests us all more than the discipline of the unworthy among us, is

The Due Reward of Youthful Genius,

well-trained skill, and honorable professional life. If we succeed in making membership in the Institute a goal eagerly sought for, it might go far towards eliminating the need of discipline. Surely most can be gained in an association of educated gentlemen by offering the hope of distinction, by honouring excellence, rather than by chastising the unworthy. For this reason I commend to your attention the changes in the by-laws proposed at Pittsburgh, and now to be acted upon, which provide that with certain exceptions all candidates for admission to membership shall be graduates from some recognised architectural school, or shall have passed examinations held by the Institute. Still more, I would give my urgent and hearty approval to the new and happy idea that our secretary has evolved of an annual election through the directors and the convention delegates of a certain number of Associates to be Fellows, because they have distinguished themselves in successful work.

Our constitution states that an election as Fellow shall be for professional merit. It has always been our aim and intention that a high standard should he maintained for the Fellowship grade, and that in some way the name of Fellow shall indicate professional distinction.

In the Institute, as in any long-established association, the young often feel as if they stood no chance for honours with those more prominent in the profession, but in an election of the sort proposed the young would take an equal stand with the old. Good work alone would count, and we should be sure that prominence and the title of Fellow would be due, not to accident or seniority, but to a general agreement among his comrades that a man is worthy of honour. With these distinctions open to our Associates, I think we should soon cease to complain that men who stand aloof from us reap the advantages in honour and remuneration that have been made possible for them by years of toil on the part of those in our Chapters. Instead of our seeking members, I think membership will be sought by all desirable men. We are asked in print "to show that an obscure man in the right is more to be honoured than an eminent man under suspicion," and we are told that if we do this the younger architects "will gladly ally themselves with the organisation and give it the new life that is vitally necessary now." The action now proposed will, I think, in a measure answer this demand.

Improving the Profession.

Let us now pass from the criticisms on our efforts "to promote the practical efficiency of the profession." Then we are met promptly by quite different criticism on our attitude towards architecture as an art. It is charged that, as a body, we do not encourage original work, and that architecture, as understood by those influential in our affairs, is only a repetition of old forms and well-worn ornaments, applied without reason and as veneers to absolutely new constructive methods. Even if varied opinions assert themselves, it is said that most of us produce nothing but imitations, more or less feeble and inappropriate, of Parisian work, of Mediæval England, of Italy in the fifteenth century or of Classic Rome itself. Perhaps the professors of architecture are worse than the architects themselves. They are described as "brooding like a blight over their schools," as lauding "symbols and figments," as "harkening to echoes," as pilfering "the spontaneity and charm of youth," and as setting up "the infallibilty of tradition." But the body of American architects, as a whole, is included in these anathemas, and we are told that the hope of the art lies with a new school that is to encourage indigenous and inventive architecture for America.

Those of us who have had as long a professional life as myself remember that in our early days the world of architecture was going to be changed by adherence to Mr. Ruskin's formulas, if not by loyalty to mediæval ideas. Since then, the pendulum has swung backwards and forwards, until we are coming to think that it does not matter whether the swing is to the right or to the left, but only whether the clock thus regulated is true to time. The chief value of any new movement is to be found in what it produces, and I believe that when it produces the interesting results we sometimes see it will be found that they rest on immutable laws, well known and applicable to other and quite different work, and we shall find it passes for new only because of new or enthusiastic methods of presentation.

New Men and Old Styles.

Happily, as I think, the horror of adapting to our uses ornamental forms endeared by long association is not widespread. Most of us shudder to think what our land would be if subjected to "a liberation of the creative impulse." This fear of plagiarism never affected architects in other ages. Wilars d'Honcourt, for instance, after sketching the chapels of Rheims, writes: "In the next page you may see the elevations of the chapels of the Church of Rheims on the outside from the beginning to the end, just as they are. In the same manner will be those of Cambray if they are rightly made." Forthwith he makes his piers at Cambray like his sketch of Rheims, which really varied somewhat from the actual work now to be seen there. Nor are other arts affected by this fear.

Most of us recognise, and are moved to enthusiasm, by a good design even when presented to us in a strange and novel guise. Let us then welcome the help of our critics whenever they show us anything true and beautiful and good.

I believe that I have thus laid before you in a general way the business that must receive your consideration, and those live issues regarding which our course is watched and is of importance. I trust we may have the wisdom to settle all these questions so that the Institute may prove itself worthy of its position as the national expression of a hard-working, scholarly, hopeful, youthful profession—to whom the necessities of bread-winning are made light by love for the art they practise.

Builders' Notes.

Workmen's Compensation Insurance Rates have dropped much since the Act came into force. The insurance companies' rates compared with the original figures are somewhat as follows, although they vary:—

	Original Tariff.	1900 Rates.
Quarriers	45s. ..	10s.
Building Trades	45s. ..	5s. to 7s. 6d.

The Bristol Master Builders' Association held its annual meeting last week, when the following officers were elected for this year: Mr. E. Walters, president; Mr. George Wilkins, vice-president; Messrs. E. I. Neale, J. Lovell, F. N. Cowlin, F. A. R. Woodward, A. Dowling, J. Eastabrook, C. A. Hayes, and W. K. Thomas, committee; and Mr. G. Humphreys, treasurer.

Building on Salisbury Plain.—Lord Ailesbury, whose property in the parish of Collingbourne Ducis adjoins that of the War Office, about half a mile from Ludgershall Station, and one and a half miles from the huge barracks about to be built at Tidworth, and close to the Perham Down training ground, is about to develop this end of his estate by letting land in large or small plots for building purposes.

Tasteless Builders.—The Hampstead Borough Council recently received a letter from Sir Richard Temple requesting the Mayor to call a public meeting of residents "for the purpose of promoting some movement to check tastelessness, inconsiderateness, and unnecessary destruction of the beauties, amenities, and interests of Hampstead on the part of architects, agents and builders." The suggestion was referred to a committee.

London County Council.—At last week's meeting of the Council (the first since the Christmas recess) the estimate of £89,000 submitted by the Finance Committee for the erection of buildings, &c., for an epileptic colony on the Horton estate, Epsom, to accommodate 300 insane male epileptic patients and staff, was approved.

The Nottingham Master Builders' Association held its annual meeting recently, Mr. W. Edgar (the retiring president) being in the chair. The audited cash account for the year was presented by the treasurer, Mr. J. W. Woodsend, and showed an increased balance in hand. The chairman gave a short account of the work of the association during the past year, showing that several matters of importance and interest to the trade had been dealt with. The officers for the coming year were then elected as follows:—President, Mr. Henry Vickers; vice-president, Mr. Frederick Fish; treasurer, Mr. J. W. Woodsend; hon. sec., Mr. James Wright.

THREE NOTABLE BRIDGES.

AT a meeting of the Institution of Civil Engineers held on December 18th three papers were read dealing respectively with Glasgow Bridge; the railway bridge over the Fitzroy River at Rockhampton, Queensland; and the Niagara Falls and Clifton steel arch bridge. Mr. B. H. Blyth, M.A., M.I.C.E., was the author of the first, Mr. W. J. Doak, B.E., A.M.I.C.E., of the second, and Mr. L. L. Buck, M.I.C.E., of the third.

Glasgow Bridge.

Mr. Blyth's paper dealt with the taking down and rebuilding of the bridge over the Clyde at the Broomielaw, Glasgow, constructed by Telford in 1833. It mentioned the reasons which induced the Corporation of Glasgow to obtain, in 1892, an Act of Parliament for the construction of a new bridge of four spans, and later, in 1894, to obtain another Act, repealing the former and authorising a bridge to be built which, while considerably increasing the width and strengthening the foundations, still preserved Telford's original elevation. The bridge, as rebuilt, consisted of seven spans varying between 52ft. and 58ft. 10in. Each of the piers was carried by four 15ft. cylinders, which were sunk by means of pneumatic pressure to a depth of 75ft. below springing-level. Centering was provided for all the seven arches, and all the arches were completed before any of the centres were struck. The piers were of freestone masonry faced with granite, and the archstones were of granite throughout. Provision was made for gas, water and electric mains under the pavements. The work was begun in 1895, and completed and opened for traffic on May 24th, 1899.

The Fitzroy River Bridge.

Mr. Doak's paper described the railway bridge over the Fitzroy River, connecting the central railway system of Queensland with the deep-water port of Broadmount. It carried a double line of way of 3ft. 6in. gauge, and consisted of two 250ft. spans and three 100ft. spans. The open-caisson method was adopted for sinking piers Nos. 1 and 2 in the river bed, piers Nos. 3 and 4 being on land. Concrete in bags was first laid round the inside edge of the caisson, and the filling-in up to low-water level was accomplished by lowering the concrete through the water in skips. The rest of the concreting was performed in the open air in the ordinary way. For the 250-ft. spans a hog-back Linville truss was adopted, the curve of the top boom having a radius of approximately 538ft. The depth of the girder at the ends was 16ft. 6in., and at the centre 30ft. 9in. The web-bracing consisted of a double system of vertical posts and inclined ties. The cross girders were suspended to the lower ends of the vertical posts by tongue plates. The main girders were 26ft. apart from centre to centre. The 100ft. spans were carried by simple rectangular Linville trusses, 16ft. 6in. deep, with a single system of web-bracing panels. The main girders were designed to carry on each track a train-load of 0·66 ton per lineal foot, preceded by two B15 engines weighing 51·7 tons each. In floor-beams a working-stress in tension of 7·5 tons per sq. in. for dead load and 5 tons per sq. in. for live load was adopted; in main girders 7·5 tons per sq. in. for dead load and 6 tons per sq. in. for live load.

The Niagara Bridge.

Mr. Buck's paper described the bridge crossing the Niagara River between Niagara Falls and Clifton. The first structure on this site was a suspension bridge erected by the late Mr. Samuel Keefer, M.I.C.E. This had been widened and subsequently rebuilt by the author; and when the question arose of further increasing its capacity, to provide for the passage of electric trolley-cars, the author recommended the substitution for it of the steel arch bridge described in his paper. The river at the site of the bridge being 180ft. deep and having a current of between 4 and 5 miles per hour, falsework was out of the question. For several reasons it was decided to brace the ribs instead of the spandrels of the arch; but the author doubted whether a braced-rib arch was as economical as one with braced spandrels, and, after experience of both types, favoured the latter where it could be used. The bridge consisted of a main span of 840ft. and two end spans, one of 190ft. and one of 210ft. The main span was a two-hinged parabolic braced-rib arch, supporting the floor system by means of vertical bents resting on the top chords of the arch at the main panel-points; the end spans were pin-connected inverted bow-string girders. The material was basic open-hearth steel, required to have an ultimate tensile strength of 62,000lbs. to 68,000lbs. per sq. in., an elastic limit of at least 33,000lbs. per sq. in., and an elongation of at least 20 per cent. on an original length of 8in. The floor was not horizontal, being 8ft. 6in. lower at the Canadian end than at the New York end. The rise of the arch, from the centre of the end pins to the centre of the rib-trusses at the crown, was 150ft. The span was divided into 20 main panels of 42ft. each, each of these panels being divided in the ribs into two equal sub-panels. The top and bottom chords of the arch ribs were united in solid web-sections at 10ft. 6in. from the centres of the end pins. These web-sections and the end posts bore on steel castings, which in turn bore on pins of 12in. diameter and 5ft. 10in. long. The pins were supported by cast-steel shoes, resting on seats in built steel shoes, arranged to distribute the pressure uniformly over the faces of the masonry abutments. The end spans were erected first by means of falsework and next the end bents of the main span were raised.

New Patents.

These patents are open to opposition until March 7th.

1900.—Kilns.—3,584. J. W. BRIGGS, "The Holm," Barton-upon-Humber. The object of this invention (which refers to "Scotch" and "Dutch" kilns) is to utilise the heat generated in one kiln for assisting to heat another kiln. This is accomplished by connecting the kilns by flues fitted with dampers. Less coal is required than under ordinary circumstances.

Traps.—3,868. J. BRUCE, 83 Limestone Road, Belfast. An opening is provided at the top of the syphon bend, large enough to admit the hand and arm, for cleansing purposes. It is fitted with a cover which runs in a groove or dovetail recess, and is made secure with cement or putty.

Swimming Baths.—15,395. J. STOTT, Vernon Works, Lee Street, Oldham. By providing the mixing cylinder with an extra pipe connected with the bath and with an auxiliary steam pipe, a constant circulation of the water is kept up, and a uniform temperature thus easily maintained.

The following specifications were published on Saturday last, and are open to opposition until March 14th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1900.—41, RINCKLAKE, vaulted ceilings. 189, DESPREZ AND DUTHUIT, pulleys. 225, SOLON, manufacture of glazed bricks. 1,118, WHITTAKER, brick-making machinery. 2,473, DE MARCAY, electric arc lamps. 2,763, GJELLERUP, drawing boards. 3,534, EVERSHED AND VIGNOLES, LTD., AND EVERSHED, electric supply meters. 4,015, T. C. FAWCETT, LTD., AND FAWCETT, thrust bearings or footsteps for revolving shafts. 4,114, DENAEYER, manufacture of artificial stone. 4,358, SWINDELL, electric bell pushes. 4,388, THOMPSON (*Boden*), mathematical compasses. 4,721, MUSGRAVE, air-humidifying apparatus. 5,169, KNIGHT, apparatus for laying bricks for building. 5,183, NEWTON (*Carleton*), electric locks. 5,271 LEITMAYR, circular saws. 6,272, HAINES, filters. 13,294, IRBY, paint pot. 13,633, JUDD, expanding and contracting doors, windows, &c. 16,166, REISS, skylights and ventilating window. 17,825, BAXTER, machinery for washing or cleansing stone, sand, &c. 18,353, CHAUVIN, acetylene gas generators. 19,337, MCDONALD, acetylene gas generating apparatus. 20,343, ROBERTSON, shovels. 20,569, MCCONNELL, sash fasteners. 21,194, MASON AND MASON, water closets. 21,792, MACDONALD AND MACDONALD, smoke-testing appliances for drains. 21,890, THOMPSON, (*Joltes and* firm of *Zirtz and Bruno Gesellschaft mit beschränkter Haftung*), burners for incandescent gas light. 21,913, CLEMENS, presses for manufacturing facing bricks. 22,015, IMRAY (*Buente*), fireproof floors. 22,030, CROSS, doors or gates for elevator hatchways. 22,090, JOHANSON, means for automatically actuating the doors of lift wells.

Engineering Notes.

Institution of Civil Engineers: Meetings Postponed.—In consequence of the death of the Queen, all meetings of this institution are suspended until further notice.

The new Workhouse at Llwynypia, is being ventilated by means of Shorland's patent exhaust roof ventilators, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The Death is announced of M. Gramme, the eminent Belgian electrician. In 1867 and 1872 he patented electric batteries and the dynamo. For the latter he received 20,000f. from the French Government and the Volta prize of 20,000f. from the Academy of Sciences.

New Engineering Works at Yarmouth.—Messrs. W. F. Crabtree and Co. have erected new engineering works at Yarmouth covering an area of 3¼ acres, extending from Southtown Road down to the riverside. The buildings are of corrugated iron, and in the machine shop are two 12-ton travelling cranes. The works will be lighted by electricity.

Water Purification.—In the course of an application heard last week by the Railway and Canal Commission against the Southwark and Vauxhall Water Company and the Lambeth Waterworks Company in respect of their supply of water for domestic use, Mr. Charles Edward Cassall, public analyst, gave evidence of the analyses he had made of different samples, and, speaking generally, said they showed that the water was not sufficiently purified from dissolved organic matter or from organisms present in it. It was for the company to find out the best way of purifying the water. There was no doubt that a river polluted by sewage ought never to be used for a water supply, whatever the process of purification or filtration applied to it. However, given that the river was used, there ought to be adequate arrangements for purification, whatever those might be from an engineer's point of view. He had personal knowledge of the case of Chester. When he inspected the water supply there two or three years ago he found that it was heavily polluted. The local water company had dealt very effectively with this exceedingly unpromising material by adopting a superior and more thorough method of purification.

Fencing of Machinery.—The Chief Inspector of Factories desires to draw the attention of makers of machinery and appliances used in factories to the importance of adequately fencing the dangerous parts in the process of construction and fitting. While much progress has been made in applying guards to existing machinery, it is unsatisfactory to find that new machines, in other respects improved, are still sent out by the makers without due regard to this essential point, and that precautions which are taken as a matter of course in the case of those made for export are often omitted in the construction of similar machinery intended for use in the United Kingdom. Hence many serious and fatal accidents arise, and at best the fencing which can be carried out later by the purchaser is usually less effective and more costly, even apart from the risks attending delay. And further, it is obviously more easy when designing a machine to provide proper places for guards than to have to fit guards on to a machine designed without any provision being made for them. In fact, a machine otherwise well designed may be made almost valueless for trade purposes by the difficulty or impossibility of adapting to it those means of fencing which the law renders necessary.

Bricks and Mortar.

APHORISM FOR THE WEEK.

Old houses mended.
Cost little less than new before they're ended.
COLLEY CIBBER.

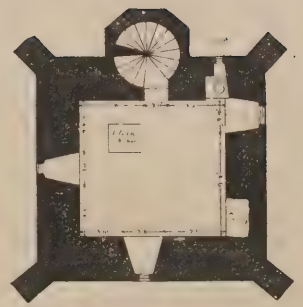
Our Plates. THE parish Church of Cockington stands in the grounds of Cockington Court, the country residence of Mr. Mallock. It is about two miles from Torquay, but within a quarter of an hour's walk from the railway station. The simplicity of the plan is one of its characteristics, and there are no transepts; there seems also to have been a careless disregard of regularity in the first instance, for, besides the fact that two adjacent walls are rarely at right angles, the windows in the north and south walls are not opposite to each other, the span of the arches in the nave arcades diminishes as we approach the chancel, and the capitals on the south side are carved, whilst those on the north are plain. Notwithstanding this, the general effect of the interior is good. The present entrance is at the west end, the south porch being now used as a vestry. On entering, an easy flight of steps leads to the nave; at the foot of these is the small but elegant font, which has a rather unique cover, and is further embellished with coats of arms displayed on each of the eight square compartments on its sides; among which are those of the Carys, Dinhams, Paulets and Carews. The wooden font-cover is entirely filled up with flat-relief carving, which has been carefully restored in one or two places where decayed. It does not lift off, the upper portion remaining stationary and the sides opening outwards, being secured by the original quaintly-wrought iron hinges. The pulpit was removed from Old Tor Church (to which it formerly belonged) about the year 1825. It is boldly carved, and still retains the original colouring and gilding. The design of the upper portion of the panels varies on each side, and is quite detached from the ground. It is also interesting to note that there is a great resemblance between the carved foliage around the pulpit at its floor level and that of one of the capitals of columns shown. The screen is a good example of late fifteenth-century work, but is rather mutilated. That portion which crosses the north aisle supported a rood-loft, the remains of which are kept in the north-east division of the church, and are intended to be refixed when sufficient funds have been collected for the purpose. No traces are to be seen of the steps which lead up to the small built-up doorway in the north wall which formerly gave access to the rood-loft; it is assumed that they occupied the same position as the private porch does at present. The tower was evidently at one time used for defensive purposes, or as a place of concealment, there being inside the door a long wooden bolt, which can be drawn out from a deep aperture in the wall (the bottom being lined with slate) and made to span the doorway, the end being inserted in an opening on the other side. There is also a fireplace on the first floor. The church, which is singular in not having any burial ground, was partially restored in 1882-3; a new organ was presented in 1893. Our drawings are by Mr. Josias C. Beare.

Extras. AT a recent meeting of the Barry School Board a member brought forward a proposal that in all future agreements between the Board and architects a clause should be inserted reserving to the Board the power of making alterations or purchases of material not specified in the contract The member in question said he did not wish to cast the slightest reflection on the profession of the architect, but they were responsible to the ratepayers for the spending of money and the extension of schools and they ought to see that their schools were extended under their own supervision. It would mean additional work to the Board, but he did not think they ought to consider their own time and convenience when extensions to schools and the purchase of additional materials were necessary. The chairman, however, very wisely pointed out that such an arrangement would not work, because it would mean that special meetings of the Board would need to be held almost continuously. In the past they had left these matters in the hands of the architects, and had been careful to get men of the highest professional reputation, and as far as he could remember he did not know of any architect going beyond what was a fair and reasonable exercise of the power vested in his hands. So the member's scheme was quashed.

Technical Education in London. A DAY SCHOOL for boys who propose to enter some branch of the cabinet-making, joinery or other wood-working trades was opened recently in the L.C.C. Shoreditch Technical Institute. The school will at first be under the control of Mr. S. Hicks, who holds a parchment certificate of the Board of Education as a trained teacher, and of an instructor who is an efficient foreman cabinet-maker, besides being a registered teacher of the City and Guilds of London Institute, with an Honours qualification. The services of additional teachers, especially in experimental science, will be secured as required. The object of the school is to enable boys who intend to enter some branch of the furniture or other woodworking trades to continue their general education, and at the same time to acquire such a knowledge of the artistic principles of design and of the scientific principles of construction, of the properties of materials, and of the use of tools, as will enable them at the end of a two or three years' course to enter a workshop with a full appreciation of the points to which they are expected to direct their attention, and with an intelligence so trained as to make them immediately of substantial value to an employer. The fee is £1 10s. a year, but the Board reserves the right to remit the fees in whole or in part in the case of boys whose parents are in receipt of not more than £2 a week. Further particulars may be obtained from the Secretary of the Institute, Pitfield Street, Hoxton, N.

Mr. Walter Crane on Sculpture. "ONE of the difficulties about monumental sculpture," said Mr. Walter Crane recently to an interviewer, "is that the Classical idea is too rooted in our midst. We must have the bareheaded figure in the open, which is ridiculous, and very opposed to the modern Englishman himself and his ideas of what is fitting. I should like myself to see—and very probably I shall see it if I live long enough into the present century—a great Pantheon with statues in niches, or else combined groups, with a certain architectural design, in the streets themselves. You might arrange national or local monuments in this fashion, with niches which could be filled from time to time. Try and weave it into your architectural scheme as it were, and so get a harmonious whole. Then, again, instead of dotting a statue here and a statue there, I would have groups designed to illustrate a man's work, with a medallion portrait of the man himself, with his record, on the pedestal."

A New Bill for Leeds. THE Leeds Law Society has issued a report in regard to certain clauses in the Bill which the Corporation is promoting in the next session of Parliament. The following are extracts:—Section 31. Attachment of brackets to buildings. Provision should be incorporated in this section that, notwithstanding payment by the Corporation in the first instance of compensation in respect of the attachment of the bracket, the Corporation shall be liable for any continuing or subsequent damage by vibration or otherwise resulting from such attachment. And the costs of assessing the damage, both original and accruing, should be borne by the Corporation and not be left for the determination of the assessing tribunal. There is no reason apparent to the Committee why the costs with regard to the acquirement of such an easement should be placed on a footing different from that relating to any other description of property.—Section 66. Provision for preventing the formation of cul-de-sacs. This is a provision which would materially increase the difficulties and expense of laying out many plots of building land. If the end of a proposed street terminated upon the boundary of an adjoining owner who was not prepared to lay out his land at the same time it would necessitate leaving 36ft. in width of the land for the whole extent of the estate being developed to provide a street at the end of the buildings, and would thus throw upon the owner the cost of providing the whole land for the street which the adjoining owner would subsequently be able to use without having contributed to the cost, except as to paving.



A Disgrace to the Florentines. THE versatile Italian art-critic Signor Ugo Ojetti publishes a strong protest against the "restoration" of Florentine monuments by the Municipality. The chief case mentioned is that of the famous Battistero of San Giovanni, which was covered with precious marbles by Arnolfo di Lapo towards the end of the thirteenth century. Exposure to the light and sunshine for centuries had given to these marbles a rich velvety colour, and the slight cracks which some of them exhibited constituted no danger to the edifice, as the wall is not built of marble, but merely covered with slabs. A year ago the cathedral authorities thought that the Battistero looked too old, and ordered it to be cleaned with pumice stone. "In the green marble slabs placed in position by Arnolfo di Lapo under the eyes of Dante," writes Signor Ojetti, "square holes were cut to support the beams which these new barbarians had ready for making the scaffolding Upon the scaffolding planks were laid, while matting was streched around to hide the work of re-embellishment. With acids, pumice stone and irons all the marbles which looked dirty were cleaned and scraped until they presented the appearance of youthful polish. Wherever the slightest crack was visible the stone, which had seen the dawns and sunsets of six hundred years, was cut away, and for yards and yards the fine old green marble was replaced with a dark marble of a colour like wet slate. The vulgar Ravaccione of a dirty-blue colour was substituted for the old white alabastrino; the edges were made sharp like razors, and looked horribly new. By degrees, as the scaffolding was taken away, the holes made for the cross-beams were filled up with stone of a 'howling,' and the interstices were filled up with painted cement. This has been done to six sides of the octagonal temple where all Florentines are baptised, and which for centuries was the cathedral of Florence. The Battistero, the most perfect example of early Tuscan art, now appears as brilliant as though it were new, and when the scaffolding and the planks are completely removed the doors by Andrea Pisano and Lorenzo Ghiberti, the statues by Danti, Rustici and Sansovino will seem in comparison dusty and lurid until someone takes it into his head to brush, wash, scrape and polish them also."

Further Acts of Vandalism. NOT content with these exploits the cathedral authorities have asked for £600 in order to "clean" in the same way the basis of the Giotto belfry. Meanwhile, no funds are forthcoming to execute works necessary for the preservation of artistic treasures in the church of San Pancrazio, the Palazzo di Parte Guelfa and the Church of San Lorenzo. San Pancrazio has been made into a cigar factory and divided into two storeys. In the Palazzo di Parte Guelfa frescoes by Giotto exist under the stucco in what are now firemen's headquarters; while the hall constructed by Brunellesco has been divided into three storeys, its pillars painted, some of its windows half built up, and the whole turned into an elementary school. Signor Ojetti's protest may help to induce the Italian public and the Government to intervene in preventing more vandalism of the kind described. Pressure of foreign public opinion will also be useful in convincing the Italians that masterpieces of art have a commercial value as attraction to sightseers, even if the Italians themselves are incapable of appreciating their beauty.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Papering Walls.

MANCHESTER.—F. B. writes: "Suppose good Buxton lime were used for plastering walls after being run for six weeks previous to mixing for use, in what time would it be safe to (*a*) paint and (*b*) paper the walls? Some say it should not be done for two years, others that it may be done as soon as the plaster is properly dry, in which latter case the upholders of the first say that there is something in the lime which is injurious to paper, &c., and it takes two years to 'kill' it. Is this so?"

Providing the materials are properly made and laid, the walls can be papered or painted as soon as they are thoroughly dry. Allow the lime to mature for three months before using, especially for work that has to be painted. Brick walls should be well swept, the mortar joints cleared, and the whole surface thoroughly wetted before applying the plaster. The mortar used for the bricks is generally insufficiently matured and when confined by the plasterer's lime forces its way through the latter and frequently spoils the paint work. Thorough slaking and maturing will kill all acids or other offensive matters in lime. Some Portland cements contain acids which take two years, or even longer, to "kill." W. MILLAR.

Government Appointments.

WOKINGHAM.—J. H. writes: "Are there any architectural appointments under Government open to professional men more than forty years of age, and, if so, where may particulars be obtained?"

Permanent appointments under Government are not obtainable by men over thirty years of age, as a rule, though exceptions are occasionally made in favour of those who have previously held temporary appointments. The so-called "temporary" appointments, however, are numerous, and are given with little regard to age, being closely analagous to assistantships in ordinary architectural, engineering and surveying offices, with the advantages of good pay with prospect of increase, short and regular hours, and the probability of a steady man being retained for many years; but of course there is no pension on retirement, and there is always the possibility of dismissal. Applications should be made to the Chief Surveyor, Royal Engineers, Horse Guards, S.W.; the Director of Works, H M. Admiralty, Northumberland Avenue, S.W.; and the Chief Surveyor, H M. Office of Works, Great George Street, Westminster, S.W.; stating qualifications, age, salary required, and whether appointment is desired in London or at out-stations. The pay varies from 6s. per day for tracing or abstract clerks to 15s. per day for good architectural or engineering draughtsmen or quantity surveyors.

G. A. T. M.

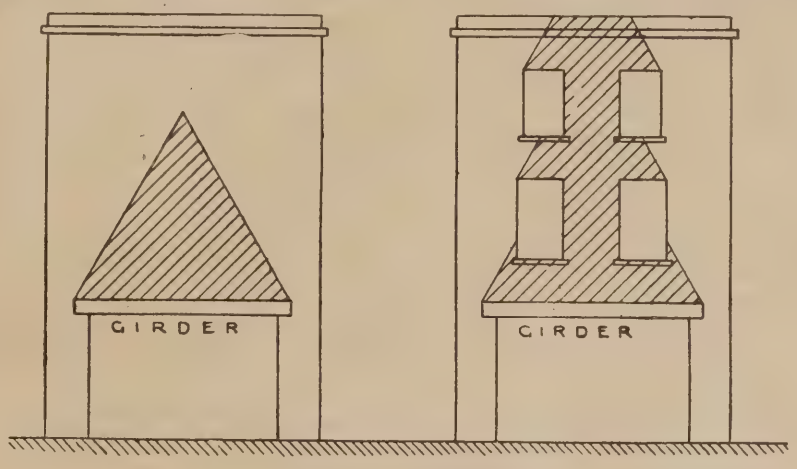
Architects' Charges.

WOKINGHAM.—J. H. writes: "If an architect fills in a printed form of agreement for contract between an employer and a builder (with 6d. stamp), is he entitled to charge for such work, or is he liable to a penalty for making such a charge?"

The architect would be liable to a penalty if he were to charge costs, because such work can only be legally charged for by solicitors.

G. A. T. M.

R.I.B.A. Journal.



EDINBURGH.—PERSPECTIVE writes: "Where can I obtain a copy of the 'Journal of the Royal Institute of British Architects'?"

This can be obtained from the offices of the Institute, 9 Conduit Street, W., price 1s. 1d. post free. It is published fortnightly during the session and monthly during the recess.

Load on Girders.

STUDENT writes: "How can I calculate the weight of loading of any given thickness and height to be carried by a girder over any opening, as a shop window in (*a*) brickwork, (*b*) stonework; when floor joists are also carried by girder, the first floor being used as (*a*) warehouse, (*b*) living room? How can I calculate the weight of a V roof carried by a girder in the centre? Is there a book on the subject?"

Brickwork may be taken approximately at 1cwt. per cub. ft. A girder supporting a solid wall is relieved from part of the weight by the bonding of the brickwork, so that the minimum load is that portion of the wall contained within an equilateral triangle having the full length of the girder for a base. When the wall is perforated by openings, the case is somewhat different, as will be seen by a comparison of the two diagrams below, where the shaded part is that forming the load on the girder. In either case any portion of roof or floor supported by the shaded part must be added to the load. The same rule would apply to stonework if it is well bonded, but generally stonework is somewhat heavier and less reliable in its bond. The weight might for the latter be taken as 1¼cwt. per cub. ft., and the angle

LOAD ON GIRDERS.

as 75deg. from the horizontal. The allowance beyond weight of material for live load on floors is 1¼cwt. per sq. ft. for living rooms, and 2 to 2½cwt. for warehouse floors according to the class of goods to be stored. The length of girder by half the depth of floor from front to back will give the area supported by the girder, when a single system of joists is adopted. With a framed floor it will depend upon the arrangement how much of the load comes on the girder. The weight of a roof may be taken as 60lbs. per ft. super. of horizontal area covered. This is sufficient to allow for weight of ceiling, truss, covering, wind, snow, &c., but special cases must of course be specially calculated. In a double roof carried by a girder under the valley between the two sets of trusses, it will be the same as if the girder carried the whole of one roof. "The Practical Designing of Structural Ironwork" (Spon, 8s. 6d) gives the mode of calculating flitched and trussed beams, joists, girders, stanchions, columns, roof trusses, &c. The catalogues issued by shop-fitters are intended as pictorial advertisements, and do not give working details to enable other people to construct from them. HENRY ADAMS.

Performance of Contracts.

SOUTH WALES.—R. O. M. writes: "A (contractor) made a contract with B (building owner) to build a certain structure consisting very largely of iron—amount of contract, £1,000. The usual form of contract as issued by the National Association of Master Builders was signed. In the quantities was the following item:—Provide the sum of £ —— to be paid Messrs. C (sub-contractors) for the whole of the iron construction as specified in detail. The specification on this point is as follows: The whole of the iron construction to be supplied and fixed by Messrs. C. No details whatever were given. As soon as A signed the contract, the architect, without notice of any kind, placed the order for the ironwork with C, and gave instructions to proceed. A never had any control over C. The result was that C did not complete the work within the time stipulated, and consequently it was quite impossible for A to complete within his contracted time. When C had completed their contract they sent the account to the architect, which account was paid by B to be deducted by them from A's account. B now seeks to enforce penalty clause against A, and a sum of about £100 is involved. A has from the first consistently repudiated liability, claiming exemption under Clause 16 that C were not under his control. The architect, while not going against A, will not commit himself. He has not certified that the works could have been completed within the stipulated time. Is A liable for the time penalty?"

A is not liable. B has paid the sub-contractors, and has therefore recognised the contract for the supply of the ironwork as an independent contract with themselves. This takes the ironwork out of A's hands, and exonerates him from all responsibility in respect thereof. Not only is A exempt therefore by the very words of the contract, but this proceeding on the part of B substitutes a fresh contract for the original one, under which fresh contract A has nothing to do with the ironwork, or with any delay on the part of the sub-contractors for the same. A. O. H.

Upstairs Stable.

LONDON, S.W.—YOUNGSTER writes: "I enclose sketch (not reproduced) of the steel construction in the floor of an upstairs stable. I have calculated the weight of floor at 3cwt. per super. ft. Is this excessive? The horses are of a heavy class, and I thought that some allowance should be made for the pounding of their hoofs when in the stalls. I should specify the steel to be of either Morelands' or Dorman Long's manufacture."

The allowance of 3cwt. per ft. sup. is not excessive under the circumstances. Dorman Long's joists are of good material. The writer does not know that Morelands are also makers, but no doubt their work would be reliable. The scantlings given are suitable for the various parts. HENRY ADAMS.

Cast-iron Columns as Ventilating Shafts.

WAKEFIELD.—J. S. writes: "Is it desirable to take vitiated air from the ground floor of a building up through cast-iron columns running up to the first floor, supported by wide piers? In what way might this be done?"

There is no difficulty in making the columns answer for foul-air flues as desired, if the required horizontal sectional area be left in the remainder of the section, after deducting the space occupied by inlet or outlets. An oval hole with the long dimension vertical will be the best shape for inlet opening, and it would be advantageous to extend the corner brackets up to the level of top of hole.

HENRY ADAMS.

Fees for Valuation.

GALLATOWN.—KIRKCALDY writes: "In the case of an architect employed for valuation of house property for the information of one party only, what is the usual scale of fees adopted?"

The scale of fees adopted by the surveyors and valuers is agreed upon yearly, and is as follows: Estate and house property, for the first £100, 5 per cent.; from £100 to £1,000, 2½ per cent.; on all above £1,000, 1½ per cent.; by auction a commission on the amount of purchase according to the above scale; out-of-pocket expenses, advertising, printing, travelling expenses, &c., are charged in addition.

E. BRAND, P.A.S.I.

Duties of a Sanitary Inspector.

RIPLEY, DERBY. — STUDENT writes: "Kindly name a good book dealing with the work of a nuisance inspector. I want something showing how a man must proceed with this work, what power he has to abate nuisances, and the methods employed with regard to notices, &c."

The duties of a sanitary inspector (inspector of nuisances) are fully described in Willoughby's "Health Officer's Pocket-book" (Crosby, Lockwood and Son, London, 7s. 6d.). Ravenhill's "Elements of Sanitary Law" (Sanitary Publishing Company, Limited, 5 Fetter Lane, E.C., 6d. nett) will also be found useful. A thorough knowledge of the various acts of Parliament relating to sanitary matters, such as the Public Health Act 1875, the Public Health (London) Act 1891, &c., is, of course, absolutely essential in carrying out the duties of this office. In London, the sanitary inspector must possess the certificate of the Sanitary Institute, or some other diploma which is recognised by the Local Government Board.

T. E. C.

Surveyors' Institution Examination.

REDDITCH.—J. H. B. writes: "(1) Can I acquire enough knowledge to pass the Surveyors' Institution examination in surveying and levelling without personal instruction? (2) Is Usell's the best book on this subject?"

(1) We do not advise anyone who is studying for an examination to fix his standard so low as to be just able to "pass," and no more. Therefore, it *may* be possible for a candidate to acquire enough knowledge of surveying from books and by the free handling of the instruments used; but as there are many minor matters that could only be learned by personal instruction we say without hesitation that personal tuition is absolutely necessary for a thorough knowledge of the subject, and, in order to attain this, thoroughness should be the object of every well-intentioned candidate. The object of the examination is to make you learn for your *own* benefit, not to oblige the examiners. If you watch our advertisement columns you will see that open-air classes are held every spring in this subject. (2) Usell's "Practical Surveying" is perhaps the best book on the subject, but there is a smaller one by G. A. T. Middleton entitled "Surveying and Surveying Instruments."

R. W. C.

How to Detect Sapwood.

LONDON, N.—STUDENT writes: "How can sapwood be detected when inspecting floor joists, rafters, &c.? Does a dark-grey tint indicate sapwood? Kindly name a good text-book on French Renaissance architecture—I mean a book similar to Anderson's 'Italian' and Blomfield's (new 8vo.) 'English Renaissance.'"

Sapwood requires close inspection and a considerable amount of experience if it is to be detected with any certainty. When each annual ring is formed it is pervious and the tissues are full of fluid; but in process of time these thicken, and the channels become filled up and obliterated. Meantime, of course, new pervious rings are growing outside, and these are sapwood; while the inner rings are becoming denser, drier, and more indistinct—"duramen" or heart wood. In duramen tubes are hard and dense, dry and thickened. In alburnum (sapwood) tubes are permeable by fluids, and the rings easily visible. A dark-greyish tint does not necessarily mean sapwood, though it may occur in it. It is due to various causes, inferior material, stacking in damp places, bad seasoning, &c. We know of no good work on French Renaissance, but a series of articles upon this subject was published about five years ago in the "Building News."

R. W. C.

External Plastering of Houses.

LONDON, S.E.—WAVE writes: "I wish to finish some houses at the seaside externally with plaster in the manner of the old farmhouses of Kent, &c. Can you tell me the best materials to use in order to give a good durable result with a cream-colour finish. I imagine that ordinary rough-cast would hold the moisture too much for it to be durable. The houses would be built of rough stock bricks with joints left open for plaster or rough-cast."

Portland cement is undoubtedly the best material for external plaster work, as it will resist damp and the effects of weather longer than any other known plastic material. If cost is a consideration use stucco, which is considerably cheaper and more easily manipulated than cement. Common stucco was generally used for the exterior work mentioned, but rough stucco would be more suitable for your purpose. This is best done in two coats: rendering and setting. The material for the rendering coat is composed of three parts of coarse sharp sand to one of hydraulic or grey lime (not chalk) and one-fifth part of good ox-hair. The setting coat is composed of three parts of washed sharp sand and two of lime, similar to that used for the rendering coat. Great care must be exercised when laying and finishing the setting coat, so that no joints are shown, or else they would never dry out, especially if colouring matter is used. The work is generally finished with a hand float. If stone is to be imitated, finish by patting the surface with a "felt float." The staining of stucco to represent the colour of stone is done by diluting sulphuric acid with water and mixing it with liquid ochres to the required tints. A cream-colour finish can be obtained by mixing yellow oxide with the setting stuff before using. Rough-cast made with coarse stuff gauged with Portland cement will repel moisture.

W. MILLAR,

Lightning Conductors.

LOUGHTON, ESSEX.—S. H. J. M. writes: "Why do some experts recommend non-insulation of lightning conductors; is not the electricity in such cases liable to go from the tape into the copper clips and so enter the wall?"

See article on this subject published in our issue for January 2nd last.

Curved Roof for 60ft. Span.

KENT.—C. W. writes: "I should be glad to know whether a curved roof for a span of 50ft. as described on page 350 of THE BUILDERS' JOURNAL for December 5th last by Mr. Arthur T. Walmisley would be applicable for a span of 60ft. If so, what alterations (if any) would be necessary? Should the diagonal braces be put between or on the outside of 7in. × 1½in. timbers, forming the tie and curved members (as in the bowstring roof described in "Specification" No. 4.)? Which would be the stronger? Would it be necessary to have the iron roofing curved to the radius of the roof, or would straight 6ft. sheets be suitable? Would 8in. by 8in. larch posts carry such a roof?"

Of the two roofs referred to that by Mr. Walmisley is the better, and no doubt the same scantlings would be suitable for 60ft. span if the depth of the truss were increased from 5ft. to 7ft. 6in., and the rise from the 7ft. to 7ft. 6in. The radii for upper and lower curves would be about 42ft. and 62ft. The diagonal bracing will be more convenient outside the top and bottom members. The number of braces would be increased in proportion to span, 3ft. being retained for apex distance. Ordinary straight 6ft. sheets would probably give to the curve of the roof. If 8in. by 8in. larch posts are used to carry such a roof they should be double, and with two wall-plates under each end of truss. One at least of each of the posts should be driven into the ground not less than 6ft. to act as a stay against the wind carrying the whole thing over, or the second post may be placed as a strut at an angle of 25 degs. from the vertical and resting on a proper footing-piece. Such a roof should not be placed in an exposed situation.

HENRY ADAMS.

Professional Practice.

Clandon.—The interesting old village church of East Clandon, which was built in the thirteenth century, has recently been restored. The building had for many years been in a very dilapidated condition. The diocesan architect, Mr. T. G. Jackson, R.A., devised the scheme. Dealing first with the principal features of the work now completed, the old transept on the north side of the nave, which was converted into a family pew at the end of the last century with an apsidal back and ceiling of lath and plaster, thus reducing it to half its dimensions, has been restored to its original size. The restoration of this transept, which had been used of late years as a vestry, necessitated the construction of a new vestry, which has been placed on the north side of the tower, eading out of the transept referred to, thus continuing the line of the exterior wall of the transept to the end of the tower. By this means the fine old sloping roof on the north side of the church has been preserved and increased. A chamber has been constructed under the vestry to effectually heat the church with hot air. The tower, which had become dangerous, has been strengthened with oak beams and supports, and the upper portion of the exterior shingled with oak. The roofs, walls and windows have also received attention. The antiquated seats have been removed, and oak seating substituted throughout, whilst an oak pulpit has been erected. The unsightly old porch, built about a century ago, has been replaced by a new structure, and the south door—the principal entrance to the church—has been restored to its former condition. A marble pavement and an oak reredos have also been provided. The ancient clock, which had been for many years in a ruinous state, is succeeded by a new clock, supplied by Messss. Gillet and Johnston, of Croydon. A new organ, consisting of two manuals and nine stops, has also been installed by Messrs. Bishop and Sons, of London and Norwich. The appearance of the chancel has been altered by the four stained-glass windows which have been placed in it. Several interesting old features, which were covered up with plaster during the last century, have also been revealed by the restoration. Among these are the steps and opening to the rood loft on the north side of the nave; an old piscina in the transept; and an old door, presumably a priest's door, in the exterior of the north wall of the chancel. The small window, commonly called a "low side" window, was found to be partially blocked up, and has been opened to its original size, showing the original sill and an old oak beam let in above the window. In digging for a new buttress foundation at the corner of the tower, two large circular stones, each with a hole in the centre, were found. These were apparently the plinth of the old font. Tracings of old fresco paintings have been found on the inside of the tower wall and chancel arch. The lath and plaster ceilings in both nave and chancel have been removed, and have exposed to view open beams of the fifteenth-century roof, which has given additional height to the church. Some old foundations were found at the entrance to the chancel, from which it might be surmised that the original church consisted of the chancel only. The outside walls, which were covered with cement, have now been stripped and the original flint walls exposed. The work has been carried out by Messrs. Holden, of Oranleigh, under the personal supervision of the diocesan architect. The cost of the work, excluding the organ, amounts to just under £2,000.

Hathershaw, Oldham. — The Hathershaw Board School extension was opened recently. The alteration consists of the addition of two

new wings to the old school and the erection of an entirely new infants' school. The extension on the side next Ashton Road consists on the ground floor of one classroom for 50 scholars and a covered playground which is arranged so that it can at a small expense be made into an additional classroom. On the first floor the extension consists of a classroom for 50 scholars similar in every respect to the one under, and a cookery classroom; the latter is fitted with range, slopstone, drainer, shelves, &c., suitable for the special purpose for which it has been erected. At the opposite end of the old school on the side next Robinson Street the extension on the ground floor consists of a classroom for 50 scholars and a large manual instruction room; above these, on the first floor, a master's room, a classroom for 50 scholars and a classroom for 60 scholars has been built. The latter classroom has been specially fitted with a circular gallery and made suitable for teaching drawing and giving demonstration lessons. Both of the new wings are connected to the old building by short corridors which give easy access to the classrooms, stairs and playgrounds. In addition to the foregoing four new cloakrooms have been constructed out of old rooms. Four new ranges of lavatories have also been provided, and a new teachers' room has also been made. Two new lavatories and w.c.'s have also been made for the use of teachers. New windows have been put in. New heating apparatus has been provided, and the gas lighting and service has been entirely renewed. Two old playsheds have been taken down and have been re-erected in a new position. The elevations to the extensions have been made to correspond with the old school. The infant school has been erected at the top of the playground with its side to Schofield Street. It has been built with a central corridor 12ft. wide. There is one entrance only, situate at the end of the corridor next Ashton Road. On entering the school there is on the right-hand side a large cloakroom, with hot pipes fixed under the children's clothes; on the left-hand side a lavatory for scholars is provided, and a mistress's room, with lavatory and w.c., &c. Further, on the right, there are three classrooms divided by folding screens which can be pushed back against the walls, converting the three rooms into one large one. On the left there are three classrooms, similar in size to those on the opposite side, but divided by walls. One of these has been built for babies, and is arranged with w.c. and lavatory adjoining. Accommodation for 320 infants is provided. The whole of the classrooms have been provided with large tablets fixed on the walls in place of blackboards, and have been fitted with cupboards, some of which are glazed for the exhibition of scholars' work and objects of interest to the children. Heating cellars, &c., are arranged under the school. The elevations have been simply treated, and are Late Renaissance in style. The buildings have been faced with Accrington brick with terra-cotta and stone dressings. The playgrounds have been remade, and the whole of the site has been redrained. New offices have been erected in the playgrounds for the use of the scholars. The work has been executed by the following contractors:—Excavating, bricklaying, concreting, and ironwork, Mr. E. Stephenson; mason's work, Mr. J. Wagg; carpenter and joiners' work, Messrs. Schofield and Co.; plumbing, &c., Mr. E. Shaw; slating and tiling, Mr. J. Jackson; plastering, Mr. J. Hall; painting, Mr. S. Boyd; heating, Messrs. Barker, of Workington; ventilation, Mr. Schofield, Oldham; cloakroom fittings, Mr. J. Davenport; wood-block flooring, Messrs. Geary and Walker, London; gas lighting, old school and extensions, Messrs. Stanley Bates. The whole of the work has been carried out from plans prepared by Messrs. Winder and Taylor, architects.

Montrose.—A new savings bank has just been opened in Castle Street. It is built on the old gable-endie pattern and is in the Scoto-Flemish style. The ground floor has three semicircular windows with heavily-moulded corners, while the entrance door is of carved oak work. On the second storey the windows are of the mullion form with tracery tops. There is a mahogany counter on the ground floor, the latter measuring 36ft. by 24ft. The walls have wooden dados with two oak chimney-pieces, the ceilings being heavily panelled in plaster work. In the rear an agent's room has been provided, and in this is a large stone safe. Upstairs is the directors' room, at the front. The other portion of the floor is reserved for the caretaker, and the top portion will be used for a store. The whole building is lighted by electricity. Mr. John Sim, C.E., was the architect. The following were the contractors:—Mason, Mr. Andrew Brown; joiners, Messrs. J. and F. Craigie; plumbers, Messrs. C. Wood and Co.; slaters, Messrs. J. Lindsay and Son; plasterers, Messrs. J. Burness and Son; upholsterer, Mr. Alex. Grieve; painters, Messrs. Middleton and Son.

Roundthorn, Oldham.—The new mixed school was opened recently. The new buildings will allow the old premises to be used exclusively for the infants. The new mixed school is situated on a rising slope to the west of Aspull Street and behind the existing school, regarding it from Roundthorn Road. It is designed on the central hall principle—that is, groups of classrooms are placed on all sides of a central hall with which they communicate and from which only they are entered. Every classroom in addition may be seen and superintended by the headmaster from the hall. The central hall is 52ft. 3in. long and 33 ft. wide and is surrounded by ten class-rooms of varying sizes, four accommodating 60 children, four for 50, two for 40, and a class of 60 seated in the hall; total accommodation, 580. Two pairs of classrooms are capable of being converted into single rooms by the removal of sliding screens. The plans have been arranged so as to permit of future extension of two class-rooms, giving a nett increase of 100 places, so that the ultimate accommodation would be 680. There are spacious entrances, cloak rooms, and lavatories for boys and girls respectively, also masters' and mistresses' private rooms. These latter rooms are so placed as to command a view of the playgrounds. There is no gymnasium, but the central hall has been fitted up for this purpose. Owing to the sloping nature of the land, which has a fall of 25ft., there is a basement under a portion of the school which has been utilised as a cookery room, &c., covered playgrounds for girls, heating cellar, and storeroom. The boys' playground is on the higher side of the school, that for the girls on the lower side, the building being placed midway on the site. In the lower playground is situated the caretaker's house facing up to Aspull Street. The building is constructed of bricks, and faced with Accrington stocks, with stone bands, mouldings, and copings. The entrances are marked by towers. The floors are laid with wood blocks, and the central hall floor is spaced out with dark oak strips for exercising and marching. The entrances have tiled floors and walls. The work has been carried out under the superintendence of Mr. A. J. Howcroft, architect, 12 Clegg Street, Oldham, by the following firms:—Messrs. John Spencer and Bros., excavating and draining; Messrs. S. and J. Smethurst, bricklayers' work; Messrs. S. and J. Whitehead, masons' work; Messrs. Mallalieu and Milne, carpenters' and joiners' work; Messrs. R. Chadwick and Sons, plumbers' work; Mr. Robert Fletcher, slaters' work; Mr. H. Wigglesworth, plasterers' work. Mr. W. F. Spencer has put in the heating, and Mr. W. Caton the lighting and ventilating installations. The wood block flooring has been laid by Messrs. Turner, Heason and Mitchell, of Manchester, and the tiling by Mr. Joseph Jackson. The iron fencing and gates have been made by Messrs. J. Jones and Sons, of Manchester.

Woolfold.—A new Sunday school has been opened for the Mission Church. It is 45ft. long by 36ft. wide, composed of strong wood framing to sides and gables, covered with corrugated iron sheeting outside, and ¾in. boarding inside, which is stained and varnished. The roof is formed of five wrought-iron principals, and also covered with ¾in. boarding and corrugated-iron sheeting. The height of the building is 11ft. to eaves, and 21ft. to ridge. There is also a large cellar with copper boiler, &c., and arrangement for parties. The heating is on the low-pressure system. The building has been erected by Mr. James Byrom, contractor, Woolfold, under the supervision of Messrs. Robt. Pritchard and J. Joseph Kendall. The plumbing work has been done by Mr. T. Shaw and Son, plumbers, Elton, and the painting and decorations by Mr. John Brooks, decorator, Woolfold. The plans have been prepared by Mr. Marshall Hamer, Woolfold. The cost has been about £400.

Law Cases.

An Unsuccessful Claim for Extras.—At Market Harborough County Court recently Messrs. Tate and Eastwood, builders, claimed £37 from George Gardiner as extra charges in connection with the erection of six cottages, the contract price for which was £1,046. The case was remitted from the High Court, Justice Bigham deciding that costs should follow the event. The chief question for decision was whether the architect, or the person acting for him, was the sole judge of what were extras, and whether his certificate was final. Mr. Nicholson (for the plaintiffs) stated that more work was done than the specifications called for, and also that the delay in the completion of the work for which £10 was charged was occasioned principally by the defendant not having grates and other things ready. The extras, or variations as they were described, were, it was stated, necessary in order to make good work, but his Honour in answer to that said if the defendant chose to have a skew house, or liked to have the roof on the ground and the basement in the air, it would be no business of the builders; and he then held that according to the contract the architect was to be sole arbiter. He nonsuited the plaintiffs, and granted the application for "locomotion costs."

Sanitary Accommodation in Factories.—In giving judgment in the recent case of *Tracey* v. *Pretty and Another*, heard in the Queen's Bench Division of the High Court of Justice, the Lord Chief Justice said that questions of very considerable difficulty were raised, and he expressed his judgment with great hesitation. He came to the conclusion that the appellant was entitled to judgment. The substantial question which arose was whether upon a summons for penalties under sub-Section 3 of Section 22 of the Public Health Acts Amendment Act, 1890, for neglect to comply with a notice given by a factory inspector, it is competent for the magistrates to receive evidence upon the merits as to the necessity for the sanitary accommodation required by such notice. The difficulty arises from the fact that the powers of the factory inspector in the matter are given by reference to the powers of the sanitary authority under the Public Health Act; and it had to be determined to what extent the powers of the sanitary authority were transferred under the general words used. His Lordship thought that if a notice could be given by a factory inspector under sub-Section 2 of Section 22 it had the same effect, if not appealed against for all purposes, as a notice given by the sanitary authority. Mr. Justice Grantham, Mr. Justice Bruce and Mr. Justice Darling concurred with the judgment of the Lord Chief Justice. Mr. Justice Phillimore, in the course of his judgment, said that at the close of the second hearing of the case his opinion was in favour of the respondents, and he still remained of the same opinion. There was no rule of law that in all sanitary acts the sanitary requirement must be left to the sanitary authority to determine upon. There was no trace of any provision anywhere making the opinion of the inspector conclusive; and direct legislation was required to make it so.

Paving of "Highways."—In the Queen's Bench Division of the High Court of Justice the case of *The Urban District Council of Leigh-on Sea* v. *King* was recently heard before Mr. Justice Bruce and Mr. Justice Phillimore. This was an appeal, by case stated, from the decision of justices of Essex dismissing an in-

formation preferred by the surveyor of the Leigh Urban District Council, the appellants, against Mr. R. S. King, the respondent, objecting to the proposals of the appellants in reference to paving, channelling and making good Rectory Grove, on the ground that it was, in whole or in part, a highway repairable by the inhabitants at large. Mr. Justice Phillimore, at the request of Mr. Justice Bruce, gave judgment first, in the course of which he said that he did not think that in every case where an additional highway was laid out the conditions of Section 23 of the Highway Act (5 and 6 Will. IV. c. 50) must be fulfilled, although that was generally the case. He thought the section only applied when the road was "made by and at the expense of any individual or private person, body politic or corporate," and it was clear that if the parish itself through its surveyor made a road, it would not come under this section, as the later provisions of the section itself showed. It was, however, more probable that this highway was intended to be a substituted one to which Sections 84 to 92 would apply. The contention of the appellants was far-reaching. Not only was the new highway not repairable by the inhabitants, though they had used it since 1842, but the old closed highway ought to be opened, and could now be opened; the owner of the soil, who had enjoyed undisturbed possession of the soil of the old highway for the same period, would have his property seriously injured, and the parishioners, the subsequent highway board (if there was one), and the present appellants would have been and be now indictable for suffering the old highway to go out of repair. He was of opinion that judgment should be given for the respondent. Mr. Justice Bruce agreed that there was evidence to support the finding of the justices.—Appeal dismissed.

Old Buildings: An Action for Trespass.—At Stonehouse County Court his Honour Judge Woodfall recently delivered judgment in the case of *Jones* v. *Water*, an action to recover £50 damages for trespass in not removing the wall of an old building sold by the Corporation to defendant, and standing upon ground which the Corporation had sold to plaintiff, which, by the conditions of sale, defendant had to remove. His Honour said the facts proved at the trial were as follows:—In 1897 the Corporation of Plymouth offered for sale certain lots of real property, of which plaintiff purchased lot 68, and defendant lot 67. The particulars of lot 67 stated that with the lot should be sold certain building materials, part of which were then erected on lot 68, and the special condition of sale stated that the purchaser of lot 67 should, within a specified time, take down and remove all buildings, the materials of which were included in his purchase, and should clear and level the same to the satisfaction of the surveyor of the vendors, and in case of default on the part of the purchaser the vendors might do and perform the said work and recover the cost from the purchaser. Defendant thereupon instructed his builder (Mr. May) to remove the buildings, and he, finding the wall he was removing comprised or terminated in a chimney-breast which was subject to an easement for lateral support of the adjoining house, saw the assistant borough surveyor and required directions what he was to remove. The assistant surveyor furnished him with a plan which excluded the chimney-breast. The builder then removed the whole of the remaining buildings and materials, and left the chimney-breast standing. It was admitted that defendant had carried out his obligation with the exception of the chimney-breast, assuming there was an obligation to remove that. Plaintiff alleged that it became necessary to remove this breast. On application defendant refused to remove it, and the Corporation refused to take action against him or to remove it themselves. Plaintiff then removed it at a cost of £20. The removal necessitated the building of a wall costing about £17, but in any view of the case he was of opinion that he would not be entitled to recover more than the actual cost of removing the wall. On these facts it was argued that the chimney-breast being defendant's property the fact of its being on the land of plaintiff entitled the latter to damages for trespass. He could not accept such a statement as a full or accurate proposition of law. If defendant had placed his chattel on the land, and against plaintiff's wall, no doubt he would have committed a trespass; but the act of defendant complained of was an omission to do something, and he thought it was clear that mere non-feasance did not constitute trespass. Again, assuming that defendant was under an obligation to remove the chimney-breast (and it was open to argument if he was), such obligation arose entirely out of his agreement with the vendors. Moreover, the same agreement provided for a breach thereof by defendant and gave to the vendors, and to the vendors only, a means of enforcing it. How could plaintiff avail himself of an agreement to which he was neither party nor privy? In his opinion plaintiff had disclosed no cause of action against defendant, and he nonsuited her with costs.

Masters and Men.

Coventry Builders' Wages.—All the men engaged in the building trade in Coventry have received an intimation from the Master Builders' Association of a proposed reduction of wages, to come into force on April 1. An alteration of working hours during the winter is also contemplated. Bricklayers, carpenters, painters, and labourers will be chiefly affected.

Glasgow Joiners' Dispute.—A large number of the men are now apparently willing to work for 9d. per hour. This portends an early settlement of the whole question. Meanwhile arrangements are being made for employing joiners in place of the men who are on strike. Arrangements are to be made for withdrawing as many non-union men as possible from the shops. The report by the General Committee of the Master Wrights' Association is to the effect that, beyond the 1,200 joiners who are on strike, a number of men are working at 9d. per hour in shops where the reduction notice is posted.

Carpenters' and Joiners' Dispute at Cromer.—The dispute between the Cromer branch of the Amalgamated Society of Carpenters and Joiners and the local builders came to a climax on Saturday, the men having refused to accept the minimum terms offered by the masters. The decision was not come to by the men unanimously, the voting being:—For the refusal of the terms, 31; against, 26. The strike is not therefore likely to seriously affect the masters. No notice was given by the local Union of the intention of the men to strike, and this has brought forth a formal protest on the part of the masters as to the mode adopted.

Birmingham Building Trades Dispute.—The difficulty that had arisen respecting the working hours of builders' labourers in Birmingham has been amicably settled. A month ago the employers gave notice to the workmen's section that in future they would require the labourers to commence work at the same time as the workmen they were assisting—carpenters, masons, or plasterers. The men asked for a rise of a halfpenny an hour, and the matter has just been considered by the wages board. The men connected with the National Association of Gasworkers and General Labourers and the Federated Labourers pointed out that the effect of the employers' demand would be that builders' labourers, except those working for plasterers, would work half an hour less per day than at present, and they wanted this made up in higher wages. The employers replied that their only object was to alter the hours of the men assisting the plasterers. At present the labourers start half an hour later than the skilled workmen—a very inconvenient arrangement. Carpenters' and masons' assistants would in no way be affected by the proposed change. The men's representatives were satisfied with this explanation, and signed an undertaking that this class of men should start at the time required, and the notices on both sides were withdrawn.

The Northern Building Dispute.—A conference was held last week at the Leeds Builders' Exchange Club between the executive of the Northern Centre of the National Building Trades Employers' Federation and representatives of the London Order of Bricklayers. The end of a long discussion left the question of peace still in the balance. The employers tried to secure a settlement which would avoid any misunderstanding such as that which arose out of the agreement in connection with the plasterers' dispute in 1899, and this display of firmness led to two or three adjournments for private consultation. Eventually the delegates accepted the principle of arbitration in relation to the Newcastle dispute only, but could not, without consulting the general body of men, come to an agreement as to who should be the arbitrator and what should be the bases of arbitration. The employers suggested the President of the Board of Trade (the Right Hon. G. W. Balfour, M.P.) or his nominee as the arbitrator, and that whatever the nature of the award it should not affect the locked-out bricklayers in the four northern counties (outside the Newcastle area), who must return to work under the rules and at the wages in force at the dates that the lock-out notices were posted. The delegates could not give any definite assurance that the men would resume their employment on the terms indicated. Failing the men's acceptance shortly the masters threaten a general lock-out. It would begin with the operatives of Lancashire, Cheshire and Yorkshire, and the National Federation would be asked to enforce action throughout the country.

Keystones.

Change of Address.—Mr. Hubert Norman, architect, has removed his offices from Swan Yard Chambers to 14 Market Square, Northampton.

Wansford Parish Church is to be restored under the direction of Mr. J. C. Traylen, architect, of Stamford. About £2,000 will be required to complete the works.

Artisans' Dwellings in Omagh.—The Omagh Urban Council have decided to forward a memorial to the Local Government Board in favour of a scheme for the acquirement of land on which to erect artisans' dwellings.

Haddington Abbey (Parish Church).—In reference to Mr. Thackeray Turner's letter printed on page 476 of our issue for last week, Mr. William Proudfoot, secretary of the restoration committee, writes to the "Times":—"We are not all vandals north of the Tweed, and Mr. Thackeray Turner may rest assured that in this instance no offensive modernisation of the transept will vex the soul of the Society for the Protection of Ancient Buildings."

St. Bride's Avenue, London, cost £10,000, and was designed by John Buonarotti Papworth, in 1824, who was: an architect, designing all sorts of buildings, from country mansions to a palace for the accommodation of Wilhelm I., King of Wurtemberg; an artist, one of the original eighteen members of the Associated Artists in Water-colours; an author and a copious contributor to periodical publications; and a landscape gardener, assisting in the laying out of the grounds of Chatsworth for Prince Leopold and Princess Charlotte. He designed a national monument to commemorate the victory of Waterloo, which was rejected by the Royal Academy. His admirers, however, compared it with the work of Michael Angelo.

Will of Mr. J. Buckley-Wilson.—Probate of the will, which bears date July 31st, 1900, of Mr. James Buckley-Wilson, F.R.I.B.A., architect, of 15 Castle Street, Swansea, who died on December 6th last, son of the late Mr. James Wilson, F.S.A., of Bath, has been granted to the testator's brother, Mr. John Henry Wilson, of 1 Belmont, Bath. The testator bequeathed to his said brother £25; to his nephew, Henry Richard Wilson, £25; and to Edith Jane Wilson, £25. Mr. James Buckley-Wilson left the residue of his estate to Cyril Spencer, or in the event of his death to Edith Irene Wilson, and his estate has been valued at £3,530 4s. gross, including personality of the nett value of £3,113 18s. 10d.

The Fisherlads' Institute at Grimsby is to be altered and enlarged at a cost of £4,000. Mr. J. J. Cresswell is the architect.

New Police and Fire Station at Oldham.—A Local Government Board enquiry was held recently into an application by the Town Council for sanction to the borrowing of £10,230 for a new police and fire station, and dwellings for the men at Townfield.

New Buildings at Romford Cottage Hospital have been erected at a cost of about £470. The alterations comprise the turning of the old operating-room into a special ward for cases of severe illness or for serious accident cases. It therefore became necessary to build another operating-room.

The River Tay.—Dr. Hugh Macmillan has prepared for press an important work on the Highland part of the course of the Tay, dealing with Strathfillan, Glendochart, Killin, Loch Tay, Kenmore, Taymouth Castle, Aberfeldy, Strathtay, Dunkeld, and it is illustrated with over 50 vivid pictures of the district by Mr. Scott Rankin, a well-known local artist. The book will be published by Messrs. H. Virtue and Co., Limited, of Ivy Lane, London.

Mr. George Wade, who has just been commissioned to execute a statue of the late Premier of Natal, Sir Harry Escombe, is at present engaged on a life-size statue of Lord Sandhurst, late Lieutenant-Governor of Bombay, for the Bombay municipality. A few years ago he executed a statue of the Duke of Connaught, also for Bombay, and he has recently finished a memorial of the late Sir Charles Keith for Aldershot, consisting of a statue with four corner figures representing the branches of the service in which Sir Charles Keith served.

New Public Baths at Leeds are proposed to be erected by the Leeds Corporation for the York Road and Bramley districts in York Road, on which it is also proposed to erect a public library. The cost of the buildings—exclusive of the expenditure on the site—will be £15,000. The Council is to be asked to sanction three premiums of £50, £30, and £15 to be offered for the best designs of a suitable building. It is proposed to erect baths for Bramley in Broad Lane, and the cost—exclusive of the site—is estimated at £8,000. In this case three premiums of £30, £20, and £10, are proposed to be given for the best designs.

Thatched Houses Permitted.—The Pershore (Worcestershire) District Council recently considered a proposal which came before them for the erection of a house with a thatched roof. It was pointed out, however, that the by-laws did not permit these old-fashioned roofings to be constructed. Mr. Sheldon protested against the abolition of thatched houses, which were one of the chief features of picturesque Worcestershire; they were also cool in summer and warm in winter. The Council very wisely took the same view, and it was agreed to take steps with the view of permitting thatched houses to be erected.

British Archæological Association.—At a meeting held on January 16th, the Rev. H. J. D. Astley, hon. editorial secretary, read some notes contributed by Mr. L. D. Jones, of Bangor, on "Yr Eglwys Wen" (The White Church). The remains are situated about seven miles from Bala, and form a rectangular level space 45ft. by 15ft. It is proposed to undertake a thoroughly systematic exploration of the site later on in order to determine, if possible, the nature of the buildings which seemingly originally existed on this spot. A paper was also read by Mr. Patrick, contributed by Dr. Fryer, on "Norman Fonts in North-East Cornwall." These fonts form a group of nine in the parishes of Altarnon, Callington, Jacobstow, Landrake, Lancost, Launceston, Lerzant, Lawhitton, and Warbstow. They are all of the Transitional Norman period, and very much resemble one another, both in design and workmanship; they are particularly interesting as affording further evidence of the existence of a band or school, or perhaps a guild, of carvers and masons. The hon. secretary announced that by the invitation of the mayor and corporation, the congress this year will be held at Newcastle-on-Tyne.

A New Parish Church at Hinksey is being erected. Only a portion has as yet been built, the eastern end wall being finished off temporarily with plaster and a temporary altar. A large carved oak screen, surmounted by an organ loft and rood of Gothic design will eventually be placed in the church.

Messrs. Radley, Robson and Mackay.—In consequence of the retirement of the senior partner and the sudden decease of Mr. Mackay, the old-established business of Messrs. Radley, Robson and Mackay, art dealers and upholsterers, will in future be carried on at 16 Old Bond Street and 10 Bruton Street by the sole remaining partner, Robert Robson.

The Ancient Parish Church of Eglwys Brewis has been reopened after undergoing repair under the superintendence of Mr. W. Weir, of the Society for the Protection of Ancient Buildings. A feature of the restoration has been the preservation of the ancient character of the building and the careful retention of everything that marks its history from the time of its first erection in the thirteenth century.

The Last Vacant Piece of Land on the Embankment, consisting of an area of 9,000ft, between the offices of the Metropolitan Asylums Board and the National Telephone Company, has recently been let by the Corporation of London upon building lease. The rental charged is only £1,700 per annum, which works out at 3s. 8d. per foot. Two years ago it is said that a bigger offer was declined.

A New Town Hall at Govan has been opened. The site of the Town Hall is on the Govan Road, at the corner of Summertown Road. The building, built of red sandstone, is in the Renaissance style. The estimated cost was between £20,000 and £30,000, but this amount will be somewhat exceeded. The architects are Messrs. Thomson and Sandilands, West George Street, Glasgow, who were selected in competition.

Swansea Harbour Offices Competition.—The report of the adjudicator on the Swansea Harbour Offices competition was submitted to the executive of the Swansea Harbour Trust last week. There were 97 sets of plans sent in, and those of Mr. E. Seward, Cardiff, were adjudged to be the best, and he obtained the first prize of £100. Messrs. Fairhurst and Thornley, Blackburn, secured the second prize of £50. The adjudicator was Mr. W. M. Fawcett, of Cambridge.

Artisans' Dwellings at Wakefield formed the subject of a Local Government Board Enquiry recently. The Corporation propose to purchase and close fifteen houses in different parts of the city, and to erect artisans' dwellings on a piece of land near the sewage and electric works. The property to be acquired is for street improvements in Drury Lane, Marygate, and Warrengate. Subsequently an enquiry was held as to the expenditure of £3,500 for works of sewage.

Municipal Houses at Brighton.—The Sanitary Committee of the Brighton Town Council have recommended the erection of thirty artisans' dwellings on the Lewes Road site to accommodate 156 persons. There are to be three blocks of four houses each, and three blocks of six, the latter to be all four-roomed houses, while of the former half are to have four and the other half five rooms. The committee estimate that the four-roomed houses can be let at 6s. and the five-roomed at 7s. per week, to repay the cost in 40 years. The houses will be situated in Dewe Road.

A new Epidemic Hospital at Arbroath is about to be erected at an estimated cost of nearly £13,000. The site fixed for the new hospital is at Hercules Den. The buildings will consist of an entrance lodge, an administrative block, and pavilions for various infectious diseases. Accommodation is provided for 35 beds in all, with operating ward, and two beds for an observation block. There is also a wash-house and laundry block. It is expected that operations for the construction of the buildings will be commenced in the beginning of February.

Street Improvements at Coventry.—The Local Government Board have sanctioned the application of the Town Council with regard to the exchange of land in New Buildings for the improvement of that street, and the borrowing of £2,000 for the construction of the road from St. Patrick's Road to Cheylesmore.

Registration of Irish Plumbers.—A deputation of members of the Parliamentary Committee of the Irish Trades Congress has just waited upon Mr. George Wyndham, Chief Secretary for Ireland, in Dublin, to urge his support of the aims of the Congress, including the registration of plumbers under statutory powers. In the course of a sympathetic reply, Mr. Wyndham expressed his sense of the importance of plumbers' work, and his opinion that a number of deaths and a great deal of disease were attributable to defective sanitation and to bad work by incompetent plumbers.

New Companies.

Cornhill Land and Building Company, Limited.

This company was registered on December 28th, 1900, with a capital of £10,000 in £1 shares to adopt an agreement with J. Stevenson, and to carry on the business of land and property owners, builders, &c. The first directors (to number not less than three nor more than seven) are to be appointed by the subscribers.

Crystalline Tile Company, Limited.

This company was registered on December 28th, 1900, with a capital of £12,000 in £1 shares to carry on the business of glass, cement, tile and chemical manufacturers and merchants, &c. The first directors (to number not less than two nor more than seven) are to be appointed by the subscribers.

H. F. Hichisson and Craggs, Limited.

This company was registered on December 28th, 1900, with a capital of £6,000 in £5 shares to acquire the business carried on at 12 Loampit Vale, Lewisham, and elsewhere in Kent, as J. G. Hichisson and Sons, and to carry on the business of timber importers, &c. The directors are H. F. Craggs, J. W. Moyses and R. Craggs. Registered office: Loampit Vale, Lewisham.

London Brick Company, Limited.

This company was registered on December 28th, 1900, with a capital of £1,000 in £1 shares to acquire the business of a brick manufacturer now carried on at Enfield, Fletton, Woodstone, and Stanground, in the counties of Middlesex, Huntingdon and Northampton respectively, as the London Brick Company, and to carry on the business of brickmakers, &c. The directors are to be appointed by the subscribers. Registered office: 7 Archway Road, Upper Holloway, N.

Bradford Brick and Tile Company, Limited.

This company was registered on December 28th, 1900, with a capital of £40,000 in £1 shares (20,000 preference) to acquire the business of brick and tile manufacturers, &c., carried on by a company of the same name (incorporated in 1868), and to carry on the business of brickmakers, &c. The directors are A. Turner, J. Bairstow, G. Watkinson, jun., and S. Watkinson. Registered office: Upper Seymour Street, Leeds Road, Bradford.

Pioneer (St. Anne's) Building Company, Ltd.

This company was registered on December 28th, 1900, with a capital of £5 000 in £1 shares to purchase or lease land in or near Alexandra Road and Clifton Street, St. Anne's-on-Sea, with certain dwelling-houses erected or in course of erection thereon, to acquire any other lands or buildings at St. Anne's-on-Sea, and to carry on the business of property owners and dealers, contractors, stone, lime, brick, and timber merchants, &c. Registered office: 20 Moore Street, South Shore, Blackpool.

Joseph Walker, Limited.

This company was registered on December 28th, 1900, with a capital of £15,000 in £1 shares to acquire the business carried on at the Victoria Bridge Timber Yard, Victoria Bridge, Leeds, as Joseph Walker, and to carry on the business of timber merchants, sawmill proprietors, timber growers, wood workers, builders, contractors, builders' merchants, &c. J. Walker is governing director for life. Registered office: 66 Water Lane, Leeds.

Jennings Pump Engineering Company, Limited.

This company was registered on December 28th, 1900, with a capital of £5,000 in £1 shares to acquire the sole agency for Great Britain and certain other countries for the Jennings Patent Centifrugal Pump, to carry on the business of centrifrugal pump manufacturers, sewerage, ventilation, and other machinery and apparatus, &c. The subscribers are to appoint the first directors. Registered office: 166 Fleet Street, E.C.

Twigg and Co., Limited.

This company was registered on December 29th, 1900, with a capital of £10,000 in £1 shares to carry on the business of quarry owners, builders, contractors, brick, stone, timber, and hardware merchants, carriage builders, engineers, &c. The first directors (to number not less than two nor more than seven) are to be appointed by the subscribers.

Greenbank Estate Company, Limited.

This company was registered on December 29th, 1900, with a capital of £2,000 in £10 shares to acquire any lands and buildings in Lancashire or elsewhere, and in particular at Rawtenstall and Bacup, and to carry on the business of land and property owners, builders, brick, tile, and terra cotta makers, &c. The first directors (to number not less than three nor more than five) are R. Worswick, R. Worswick, jun., J. A. Worswick, Mrs. J. Worswick, and Mrs. S. Duncan.

Jarmin Brothers, Sons and Co., Limited.

This company was registered on December 29th, 1900, with a capital of £2,000 in £1 shares to acquire the business carried on at 23 Hither Green Gardens, Lewisham, Kent, by R. Fawsitt, H. J. Jarman, and W. T. Knott, and to carry on the business of builders, contractors, plumbers, gasfitters, decorators, gas and electrical engineers, ironmongers, &c. The first directors (to number not less than two nor more than five) are R. Fawsitt and H. J. Jarman. Registered office: 23 Hither Green Gardens, Hither Green Lane, Lewisham, Kent.

W. R. Renshaw and Co., Limited.

This company was registered on December 29th, 1900, with a capital of £100,000 in £1 shares to acquire the business of engineers and ironfounders carried on by W. R. Renshaw and Co., and to carry on the business of builders of rolling stock, engine and boiler makers, wood workers, miners, smelters, and metallurgists, tool makers, motor-car builders; to acquire and turn to account any patents, real and personal property; to erect any mills, factories, warehouses, and other buildings. The first directors (to be not less than three nor more than six) are W. Heath, W. J. Renshaw, A. E. Renshaw, and W. R. Renshaw. Registered office: Phœnix Engineering Works, Stoke-on-Trent, Staffordshire.

London Securities, Limited.

This company was registered on December 29th, 1900, with a capital of £50,000 in £1 shares (49,000 ordinary and 1,000 deferred shares) to acquire and turn to account land, house, and other property; to erect dwellings for the industrial classes; as builders, contractors and decorators, club or hotel proprietors, &c. The first directors (to be not less than three nor more than five) are to be elected by the signatories, R. A. Dowse, F. Welford, H. B. Haynes, E. Winn, E. W. Randall, A. J. Poulter, and E. C. Scott.

Merch Land Company, Limited.

This company was registered on December 29th, 1900, with a capital of £1,000 in £1 shares to acquire and turn to account land and buildings in England or Wales, and to carry on the business of builders, &c. Registered office: St. Mary Street, Cardiff.

C. Gude and Son, Limited.

This company was registered on December 29th, 1900, with a capital of £11,000 in £1 shares to acquire the business of C. Gude and Son carried on at 177 Dalston Lane, N., and to carry on the business of housebreakers, contractors, engineers, builders, builders' merchants, gravel merchants, carmen, &c. C. Gude is the governing director.

Coalbrookvale Collieries Company, Limited.

This company was registered on December 24th, 1900, with a capital of £40,000 in £10 shares to carry on the business of landowners, miners, clay workers, &c. The first directors (to number not less than two nor more than five) are W. Barnes and F. W. Barnes (managing directors). Registered office: Derby Buildings, 24 Fenwick Street, Liverpool.

Abraham Booth, Limited.

This company was registered on December 24th, 1900, with a capital of £5,000 in £10 shares to carry on the business of a land, building and investment company, and the business of builders, contractors, brick, tile, pipe and pottery manufacturers, timber, sand and lime merchants, auctioneers, house and estate agents, farmers, &c.

Colet Estates, Limited.

This company was registered on December 29th, 1900, with a capital of £15,000 in £1 shares to carry on the business of land and property owners and agents, builders, contractors, decorators, stone, sand, lime, brick, timber, and hardware, merchants, &c. The first directors (to number not less than three nor more than seven) are A. Moore, H. Baddeley, T. Moore and W. Baddeley. Registered office: 7 Leadenhall Street, E.C.

Aberthaw Portland Cement Manufacturers, Lim.

This company was registered on December 29th, 1900, with a capital of £20,000 in £1 shares (10,000 preference) to acquire the business of a Portland cement manufacturer carried on by E. T. Ferrier at Rhoose, near Cardiff, and to carry on the business of manufacturers of and dealers in slate, cement, lime, limestone, plaster, artificial stone, whiting, bricks, tiles, timber, hardware, and building materials of all kinds.
